Senior Biologist/Owner

Author Qualifications

This report was prepared by Ed Miller and Liliana Hansen.

Ed Miller is a senior biologist and co-owner of Miller Environmental Services, LLC, who specializes in wetlands, wildlife, and habitat assessments. He is a Society of Wetland Scientists certified Professional Wetland Scientist (PWS), #1895. Mr. Miller obtained a Bachelor of Science in Terrestrial Ecology from Western Washington University in 1993 and a Masters of Environmental Science and Management with a focus on Watershed Management at the University of California at Santa Barbara in 2000. His 17 years of experience includes preparing wetland delineations and reports, wetland functional assessments, stream and shoreline ordinary high water mark determinations, habitat conservation area reports, mitigation design, mitigation monitoring and floodplain habitat assessments for FEMA Endangered Species Act compliance. Mr. Miller has completed project permitting and compliance for agencies including U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, Washington Department of Fish and Wildlife, Washington Department of Ecology.

Liliana Hansen is a senior biologist and co-owner of Miller Environmental Services, LLC. She is a Society of Wetland Scientists certified PWS, #2755. Ms. Hansen received a Bachelor of Science from Western Washington University in Environmental Science and has been working as a consulting biologist since 2003. Ms. Hansen's experience includes wetland delineations, floodplain habitat assessments for FEMA Endangered Species Act compliance, wetland and buffer mitigation design and monitoring, stream and shoreline ordinary high water mark determinations, environmental permitting. She has managed projects from the preliminary site assessment stage through permitting with the Corps, USFWS, WDFW, Ecology, and local jurisdictions.

Disclaimer

This report and wetland and/or stream delineation, is based on protocols that are described and defined in manuals and publications utilized by Federal, State, and Local agencies. The wetland delineation methodology used is consistent with the *Washington State Wetlands Identification and Delineation Manual* (Ecology, 1997), the *U.S. Army Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory, 1987), *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region* (Corps, 2010), and subsequent Corps guidance. Completed work is based on conditions at the time of the site visit. No guarantees are given that a delineation determination or assessment will concur exactly with those performed by regulatory agencies or by other qualified professionals.

1.0 INTRODUCTION

At the request of the applicant, Barkley Meadows LLC, Miller Environmental Services, LLC (MES) conducted a wetland delineation on an 11.22 acre property located west of Chandler Parkway and south of Bristol Way (tax parcel 380316 372176), Bellingham, Washington; Section 16, Township 38 N, Range 03 E, W.M. The project location is shown below on **Figure 1**. A map of the property and critical areas is included as **Appendix A**.

This report presents the best professional judgment of MES in estimating the subject jurisdictional boundaries using the most up-to-date regulations, written policy, and guidance from the regulatory agencies. However, only the regulatory agencies can make a final determination of jurisdictional boundaries.

1.1 PURPOSE

This Critical Areas Report was conducted as required within the City of Bellingham Critical Areas Chapter [Bellingham Municipal Code (BMC) 16.55]. This report documents the location and nature of critical areas (wetlands and fish and wildlife habitat conservation areas) on and in the vicinity of the project site.

Figure 1: Vicinity Map

2.0 METHODS

2.1 PRELIMINARY RESEARCH

Published information about local conditions was reviewed for known critical area occurrences in the project vicinity. The information reviewed included:

- *National Wetlands Inventory (NWI)*, *Wetlands Mapper*, United States Fish and Wildlife Service (USFWS);
- *Priority Habitats and Species Mapper*, Washington State Department of Fish and Wildlife (WDFW);
- *SalmonScape Mapper*, WDFW;
- *City of Bellingham CityIQ*, City of Bellingham;
- *Web Soil Survey*, United States Department of Agriculture, Natural Resource Conservation Service (NRCS);
- *National Hydric Soils List*, United States Department of Agriculture, NRCS; and
- *National Map Viewer*, United States Geological Survey (USGS).

2.2 FIELD INVESTIGATION

A site investigation of the properties was conducted on June 13, 2018 to document site conditions. This included a wetland delineation and an assessment of onsite habitat. MES flagged wetland boundaries and data plot locations. Wetland boundaries were surveyed and mapped by professional land use surveyors. Site photographs taken during the site visit are included within **Appendix B**.

Wetlands were identified on the basis of hydrophytic vegetation, hydric soils, and evidence of wetland hydrology as described in the *U.S. Army Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory, 1987), *Corps Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region* (U.S. Army Corps of Engineers, 2010), and subsequent U.S. Army Corps of Engineers (Corps) guidance.

Hydrophytic vegetation (i.e., plants adapted to saturated soil conditions) was determined to be present when dominant cover of plants observed (greater than 50 percent) had an indicator status of facultative (FAC), facultative wetland (FACW), or obligate wetland (OBL). Plant species on-site were identified according to Cooke (1997), Pojar and MacKinnon (1994), and Hitchcock and Cronquist (1973). Plant indicator status was determined using the *Western Mountains, Valleys, and Coast 2012 Final Regional Wetland Plant List* (Lichvar, 2016).

Hydric soils were determined according to the methodology in the *Field indicators of Hydric Soils in the United States, A Guide for Identifying and Delineating Hydric Soils, Version 8.1* (USDA NRCS, 2017).

Wetland hydrology was determined through the observation of soil saturation, surface ponding, or other primary and secondary indicators such as water marks, drift deposits, iron

deposits, surface cracks, water stained leaves, drainage patterns, etc. (U.S. Army Corps of Engineers, 2010). Data were collected on vegetation, soils, and hydrology at each data plot and recorded on data forms (**Appendix C**).

2.3 WETLAND CLASSIFICATION AND FUNCTIONAL ASSESSMENT

Wetlands were classified using the USFWS wetland classification system (Cowardin et al., 1979). A wetland rating was completed for the on-site wetlands, using the 2014 Washington State Wetland Rating System for Western Washington (Ecology Rating System) (Hruby, 2014). Rating forms are included in **Appendix D**.

Wetland delineators visited each wetland and determined wetland classes and categories using field observations and resources utilized during the preliminary data review process. Ecology recognizes four categories of wetlands based on sensitivity to disturbance, rarity, the functions they provide, and difficulty to replace.

A qualitative functional assessment was also conducted for the wetland based on the Ecology Rating System (Hruby, 2014). Hydrologic, water quality, and habitat functions were evaluated based on the scoring criteria listed in **Table 1**.

Table 1: 2014 Wetland Functional Assessment Criteria

Wetland Functions	Criteria		
	Low Score	Moderate Score	High Score
Water Quality Functions	3-4	5-7	8-9
Hydrology Functions	3-4	5-7	8-9
Habitat Functions	3-4	5-7	8-9

3.0 PROJECT AREA SETTING

3.1 WATERSHED

The north portion of the property is located within the Squalicum Creek watershed and the south portion of the property is located within the Whatcom Creek watershed, both located within Water Resource Inventory Area (WRIA) 01.

Runoff from the southeast portion of the property drains eastward toward a biofiltration swale adjacent to a gravel trail, which drains southwest. City IQ mapping specifically labels this feature as the Woodside Biofiltration Swale BMP T9.20. Runoff from the southwest side of the property drains southward. Runoff from the northwest corner of the property flows northwest onto adjacent properties to the north and northwest.

3.2 PROJECT VICINITY

The project site is located within an urban area of the City of Bellingham. Adjacent areas to the north, east, west, and south are developed with single-family homes. An undeveloped parcel (a mix of forest/shrub and herbaceous vegetation) is located to the southwest.

3.3 REVIEW AREA

The review area consists of the entire tax parcel 380316 372176. While the entire parcel was reviewed, wetland boundaries on the west side of the property were not flagged – as they were a significant distance from any potential development on the east side of the property. The property consists of undeveloped forest dominated by Douglas fir (*Pseudotsuga menziesii*), big-leaf maple (*Acer macrophyllum*), red alder (*Alnus rubra*), and Western red-cedar (*Thuja plicata*). Three wetlands are located on the west side of the property and a steeply sloped hillside is located on the east half of the property. A gravel trail is located through the center of the property (north-south) with a biofiltration swale located on the west side of the trail. The biofiltration swale carries stormwater offsite to the south and into a larger stormwater facility. A site map is included in **Appendix A**. Site photographs are included in **Appendix B**.

4.0 RESULTS

4.1 PRELIMINARY RESEARCH

4.1.1 National Wetland Inventory and CityIQ

A Palustrine forested wetland is mapped on the northwest corner of the property on the National Wetlands Inventory (NWI) Mapper (USFWS, 2017). The City of Bellingham IQ Mapper shows a large Palustrine forested wetland on the west side of the property, based on the 1992 wetland inventory. A wetland delineation from 2015 indicates the presence of a wetland in the vicinity that MES identified Wetlands A and B (City of Bellingham, 2018).

4.1.2 Soils Survey Data

The western portion of the review area is mapped with Whatcom silt loam, 3 to 8-percent slopes (soil unit 179). The northeast portion of the review area is mapped with Squalicum gravelly loam, 5 to 15-percent slopes (soil unit 156), while the southeast portion is mapped with Squalicum gravelly loam, 15 to 30-percent slopes (soil unit 157) (NRCS, 2018). Whatcom and Squalicum soils are non-hydric (NRCS, 2014).

Figure 2: Soils Map

4.1.3 WDFW Priority Habitats and Species Data

The Washington State Fish and Wildlife Priority Habitats and Species (PHS) Mapper identifies the entire township that includes the review area with Big Brown Bat (*Eptesicus fuscus*). WDFW also maps a wetland in the location shown on the NWI Mapper (WDFW, 2018).

4.1.4 City of Bellingham Habitat Restoration Technical Assessment

The City of Bellingham's 2015 Habitat Restoration Technical Assessment identifies the subject site within "Forest Block 149". This forest block is not identified as a top priority restoration area.

4.2 FIELD INVESTIGATION

4.2.1 Uplands

The eastern half of the property is dominated by upland area on a forested slope. Vegetation includes Douglas fir, Western red-cedar, red alder, big-leaf maple, vine maple (*Acer circinatum*), low Oregon-grape (*Mahonia nervosa*), snowberry (*Symphoricarpos albus*), red

huckleberry (*Vaccinium parvifolium*), sword fern (*Polystichum munitum*), bald-hip rose (*Rosa gymnocarpa*), and beaked hazelnut (*Corylus cornuta*).

Upland soils vary throughout the property, but generally consist of very dark brown (10YR 2/2) loam at the surface with dark yellowish brown (10YR 3/4) or very dark grayish brown (10YR 3/2) silt loam below. Upland data is documented in data plots (DP) 2, 4, 6, and 8 in Appendix C.

4.2.2 Onsite Wetlands

Three wetlands, Wetlands A, B, and D were identified in the review area, in the western half of the property. The wetlands are summarized below in Table 2.

Table 2: Project Wetlands Summary

Wetland	Cowardin Classification	Ecology Category	HGM Class	Ecology Habitat Score	City of Bellingham Buffer Width (Feet) ¹
A	PFO/PSS	III	Depressional	Moderate (5)	150
B	PFO	III	Depressional/Slope	Low (4)	80
D	PFO	IV	Slope	Low (4)	50

¹Assumes high intensity land use proposal – more than one unit per acre.

Wetland A

Wetland A is a large Palustrine forested and scrub/shrub, depressional wetland that extends throughout the southwest portion of the property and onto the adjacent property to the south. The wetland may also extend offsite to the west slightly. MES flagged the eastern wetland boundary and the western boundary was observed but not flagged. A prior wetland boundary for the east side of the wetland was utilized for mapping purposes (Cantrell and Associates, Inc.). The wetland and data point locations are shown on the attached site map in Appendix A.

Vegetation. Vegetation in Wetland A consists of Western red-cedar, red-osier dogwood (*Cornus sericea*), swamp currant (*Ribes lacustre*), black twinberry (*Lonicera involucrata*), salmonberry (*Rubus spectabilis*), skunk cabbage (*Lysichiton americanum*), and lady fern (*Athyrium felix-femina*).

Hydrology. At the time of the site visit in June 2018, Wetland A had a water table at -11 inches below the surface and saturation at -7 inches below the surface. The wetland is seasonally saturated and seasonally ponded, draining south through a culvert under Barkley Boulevard into a wetland on the south side of Barkley Boulevard. The wetland receives hydrology from surface and subsurface runoff from the property to the west. The wetland receives water runoff from adjacent upland areas, Wetland B and the biofiltration swale at several points just south of a culvert outlet to the biofiltration swale from the east – carrying stormwater from Chandler Parkway.

Soils. Soils in Wetland A consist of black (10YR 2/1) silt loam with redoximorphic concentrations from the surface to 17 inches depth. Below 17 inches, soils consist of dark

grayish brown (10YR 4/2) clay loam with redoximorphic concentrations and depletions. Soils in Wetland A meet hydric soil A12 – thick dark surface.

Wetland Rating. Wetland A is classified as a Palustrine forested and scrub/shrub wetland using the USFWS wetland classification system (Cowardin et al., 1979). Per the City of Bellingham Code the wetland was rated using the 2014 Ecology rating system (Hruby, 2014). The wetland received a total score of 18 points with a habitat score of five points (moderate). The wetland had no special characteristics and was rated as a Category III wetland using a functional score of 18. Wetland A requires a 150-foot buffer based on a proposed high intensity use.

Wetland B

Wetland B is located in the northeast portion of the property. The wetland is a Palustrine forested, depression/slope wetland. The eastern boundary of the wetland was flagged by MES and surveyed by professional and use surveyors. MES visually observed the western but did not flag it. A prior delineated boundary by Cantrell and Associates, Inc.) was similar to the MES observed western boundary and was incorporated into the existing conditions map. The wetland and data point locations are shown on the attached site map in **Appendix A**.

Vegetation. Vegetation in Wetland A consists of red alder, Western red-cedar, black twinberry, salmonberry, lady fern, slough sedge (*Carex obnupta*), and water parsley (*Oenanthe sarmentosa*).

Hydrology. At the time of the site visit in June 2018, Wetland B had a water table at the surface. The wetland is seasonally saturated and seasonally ponded. The northern portion of the wetland drains northwest while a majority of the wetland drains south toward Wetland A. The wetland receives hydrology from surface and subsurface runoff from the property to the west. The wetland receives minimal runoff from the area to the east due the presence of a biofiltration swale that intercepts a majority of runoff from the hillside on the east side of the property.

Soils. Soils in Wetland B consist of black (10YR 2/1) clay loam from the surface to 17 inches depth. Below 17 inches, soils consist of dark grayish brown (10YR 4/2) clay loam with redoximorphic concentrations. Soils in Wetland B meet hydric soil A12 – thick dark surface.

Wetland Rating. Wetland B is classified as a Palustrine forested and scrub/shrub wetland using the USFWS wetland classification system (Cowardin et al., 1979). Per the City of Bellingham Code the wetland was rated using the 2014 Ecology rating system (Hruby, 2014). The wetland received a total score of 17 points with a habitat score of four points (low). The wetland had no special characteristics and was rated as a Category III wetland using a functional score of 17. Wetland B is required to have an 80-foot buffer based on a proposed high intensity use.

Wetland D

Wetland D is a small (447 square feet), Palustrine forested, slope wetland located in the northwest corner of the property. The wetland and data point locations are shown on the attached site map in **Appendix A**.

Vegetation. Vegetation in Wetland D consists of red alder, salmonberry, black twinberry, and lady fern.

Hydrology. At the time of the site visit in June 2018, Wetland D did not have observable hydrology. Wetland D is a seasonally saturated (in early spring) slope wetland. The wetland drains northwest onto adjacent properties. The wetland receives surface and subsurface runoff from the area to the east, including the northern end of Wetland B, and does not appear to receive stormwater runoff from Bristol Way (curbed and guttered), which is located just north of Wetland D.

Soils. Soils in Wetland D consist of black (10YR 2/1) loam from the surface to 10 inches depth. Below 17 inches, soils consist of dark grayish brown (10YR 4/2) loam with redoximorphic concentrations. Soils in Wetland D meet hydric soil A11 – depleted below surface.

Wetland Rating. Wetland D is classified as a Palustrine forested wetland using the USFWS wetland classification system (Cowardin et al., 1979). Per the City of Bellingham Code the wetland was rated using the 2014 Ecology rating system (Hruby, 2014). The wetland received a total score of 14 points with a habitat score of four points (low). The wetland had no special characteristics and was rated as a Category IV wetland using a functional score of 14. Wetland D is required to have a 50-foot buffer based on a proposed high intensity use.

4.2.3 Fish and Wildlife Habitat Conservation Areas

Pileated Woodpecker

Priority habitats and areas associated with state priority species are considered habitat conservation areas under SCC 14.24.500(1)K. Pileated woodpecker (*Dryocopus pileatus*) is a candidate species in Washington State. Additionally, pileated woodpecker breeding areas are listed as a priority habitat. The breeding areas include areas necessary to support reproduction and the rearing of young, including breeding sites and adjacent foraging habitat.

This species is a year-round resident in Western Washington inhabiting forested areas that may include: mature, old-growth forests, and second-growth forests with large snags and fallen trees (Lewis and Azerrad, 2004). Large snags and large decaying live trees are necessary for nesting and roosting. Forests less than 40 years old may be utilized as foraging habitat.

The subject property is a mixed a coniferous and deciduous forest (Western red-cedar and Douglas fir). Several snags and decaying live trees were observed onsite and extending onto adjacent properties to the east. MES observed one live tree with evidence of Pileated woodpecker excavations, located at the southern end of the lot.

Priority Snags and Logs

Priority snags and logs are considered a habitat conservation area under WCC 16.16.710.C.3. as they are a state priority habitat. To qualify as a priority feature, snags must be more than 20 inches diameter at breast height (dbh) and 6.5 feet in height. Priority

logs must be more than 12 inches in diameter at the greatest width and more than 20 feet long. Several priority logs were observed on the property.

Mature Forest

WDFW defines a mature forest as one that has an average stand with trees exceeding 21 inches dbh that is more than 7.5 acres in size (WDFW, 2008). Several mature trees are located onsite; however, the patch of mature trees is less than four acres in size and includes only the eastern portion of the property. Therefore, mature forest, as defined by WDFW, does not occur on the property.

Bats

Priority habitats and areas associated with state priority species are considered habitat conservation areas under WCC 16.16.710(C)3, including Big Brown Bat.

A Big Brown Bat communal roost is mapped within the township that includes the subject property (WDFW, 2018). WDFW has a *Living with Wildlife: Bats* informational flyer and additional information on bats available at: <https://wdfw.wa.gov/living/bats.html> (WDFW, 2018).

Bat roosting may occur onsite, although MES did not directly observe any roosting during a site visit in June.

4.2.4 Off-site (Adjacent) Critical Areas

Off-site areas were viewed as feasible given visibility conditions at the time of the site visit. Other information was used where applicable including aerial photography and CityIQ mapping to assess off-site conditions.

Off-site Areas- West

The area west of the property is partially developed with single-family residences, yards, and undeveloped small patches of forest. A majority of the area immediately west of the property consisted of upland forest similar to the upland forest between Wetlands A and B, and included Western red-cedar, red alder, salmonberry, vine maple, thimbleberry, Himalayan blackberry (*Rubus armeniacus*), snowberry (*Symphoricarpos albus*), Indian plum (*Oemleria cerasiformis*), and sword fern. Wetland A likely extends offsite to the west slightly, based on a wetland delineation by Cantrell and Associates, Inc. from CityIQ (City of Bellingham, 2018).

Off-site Areas- East

The general topography of the site and offsite areas to the east is a steep slope up to the east. Chandler Parkway is located along the east side of the property, in the northern half. Single-family homes and yards are located east of the property, in the southern half. No obvious wetlands were observed offsite to the east.

Off-site Areas- South

The area south of the property is currently under construction with single-family homes or is partially undeveloped forest, similar to the upland forest located in the eastern half of the property. Vegetation in this area includes Douglas fir (*Pseudotsuga menziesii*), big-leaf maple, red alder, baldhip rose (*Rosa gymnocarpa*), low Oregon-grape (*Mahonia nervosa*), snowberry, beaked hazelnut (*Corylus cornuta*), red huckleberry (*Vaccinium parvifolium*), and sword fern. No obvious wetlands were observed south of the property.

Off-site Areas- North

Bristol Way is located on the north side of the property.

4.3 WETLAND FUNCTIONAL ASSESSMENT

Wetland functional value was assessed for utilizing the Ecology Wetland Rating Form for Western Washington (Hruby, 2014). This rating method evaluates wetlands based on three categories of function, which include water quality, hydrologic function, and habitat value.

Table 3: Wetland Functional Value Summary¹

Wetland	Water Quality Function	Hydrologic Function	Habitat Function
A	Moderate (7)	Moderate (6)	Moderate (5)
B	Moderate (7)	Moderate (6)	Low (4)
D	Moderate (5)	Moderate (5)	Low (4)

¹Raw functional value scores included in parentheses

4.3.1 Water Quality Function

Water quality function is assessed by characterizing the amount and type of vegetation present within a wetland. Plants enhance sedimentation by acting like a filter causing sediment particles to drop to the wetland surface. Other variables include the average slope within slope wetlands, outlet type, and amount of seasonal ponding within depressional wetlands. The potential for the landscape to support water quality functions is also assessed, including potential pollutant sources from stormwater septic systems or other sources. Additionally, water quality value to society is assessed based on the wetland's proximity to polluted waterbodies, with the assumption that wetlands can improve water quality before reaching downstream waterways.

Wetlands A, B, and D provide moderate water quality functions. Wetlands A and B have the potential to provide water quality functions with seasonally flowing outlets, persistent vegetation, and seasonally ponded areas. The wetlands are located in a landscape that contributes runoff from developed areas, particularly Wetland A, which receives direct stormwater runoff via a biofiltration swale that spills into the wetland. Wetlands A and B are located in the Whatcom Creek watershed and drain into Fever Creek, which is listed on the 303(d) list for poor water quality. As a result, the water quality functions provided by these wetlands are considered valuable to society.

Wetland D has limited potential to provide water quality functions, due to the slope of the wetland (more than five percent), and lack of runoff into the wetland from pollutant sources.

However, the wetland drains to Squalicum Creek, which is listed on the 303(d) list for poor water quality, thereby increasing the rated value to society for water quality improvement.

4.3.2 Hydrologic Function

Wetlands have the ability to reduce flooding and stream erosion in downstream areas. This is accomplished through the entrainment, storage, and slow release of water, which acts to moderate flood pulses following storm events. Characteristics of this function include the vegetation characteristics (reduction of water velocity in slope wetlands), outlet type, and depth of storage for depressional wetlands. Hydrologic function is also influenced by the landscape and input of potential stormwater discharges and excess runoff from urban and developed areas. The hydrologic function of a wetland is also assessed in relation to its value to society. Wetlands that are located upstream of flood zones may help reducing flooding and protect down-gradient resources (human or natural).

Wetlands A and B provide moderate hydrologic functions. These wetlands have the potential to reduce flooding and erosion with seasonally flowing outlets, shallow ponding capacity, and small to medium-sized contributing basins. Both wetlands have the potential to support hydrologic functions as they receive stormwater runoff. Additionally, the contributing basin for Wetland A includes developed/urban areas that generate excess runoff. Wetland A receives stormwater runoff directly from a biofiltration swale that captures runoff from the residential development to the north and Chandler Way to the east.

Wetland D provides moderate hydrologic function – though at a lower level than Wetlands A and B. While the wetland contains dense woody vegetation that may intercept runoff, the wetland does not intercept runoff from developed areas.

4.3.3 Habitat Function

Wetlands can provide habitat value to a variety of wildlife species by providing a variety of habitat types, water regimes, habitat features (such as snags and downed logs), and number of plant species. Additionally, the wetland's opportunity to provide habitat is important, as characterized by buffer condition, corridors and connections, position in the landscape, and proximity to priority habitats and undisturbed habitat.

Wetland A provides moderate habitat function. The wetland has two habitat types (forest and scrub/shrub), two hydroperiods, moderate habitat interspersions, and habitat features including snags and logs. The landscape within one kilometer of the wetland has very little potential to support habitat functions of the wetland, due to the presence of dense urban development.

Wetlands B and D provide low habitat function, due to one habitat type (forest), one or two hydroperiods, and no habitat interspersions. These wetlands also lack accessible habitat within one kilometer due to their location within a dense urban area.

5.0 REGULATORY REQUIREMENTS

The wetlands identified on the property are subject to federal regulations under the Clean Water Act (CWA) Sections 404 and 401, as well as state regulations under the Growth

Management Act administered by the City of Bellingham under the Critical Areas Chapter (BMC 16.55).

5.1 CWA SECTION 404- US ARMY CORPS OF ENGINEERS

Pursuant to Section 404 of the CWA, the Corps regulates the discharge of dredged and/or fill material into waters of the United States, including wetlands. Any impacts to onsite wetlands would require a Nationwide Permit (for up to 0.5 acre of wetland fill) or an Individual Permit (for greater than 0.5 acre of wetland fill).

5.2 CWA SECTION 401- DEPARTMENT OF ECOLOGY

Ecology is the state agency responsible for administering the CWA Section 401 Water Quality Certification program. Impacts to wetlands may require approval or a waiver from the Department of Ecology.

5.3 CRITICAL AREAS ORDINANCE- CITY OF BELLINGHAM

The City of Bellingham regulates critical areas, including wetlands and their associated buffers, and fish and wildlife habitat conservation areas under Title 16, Chapter 55 of the Bellingham Municipal Code. Impacts to wetlands and buffers require a Critical Areas Permit and compensatory mitigation. Buffer widths are determined based on the proposed land use intensity, wetland category, and habitat score. Wetland A requires a 150-foot buffer, Wetland B requires an 80-foot buffer, and Wetland D requires a 50-foot buffer. With appropriate mitigation sequencing, the Wetland A buffer may be reduced by 25-percent, to 112.5 feet; the Wetland B buffer may be reduced to 60 feet; and the Wetland D buffer may be reduced to 40 feet. The City of Bellingham Code (BMC 16.55.340.G) also requires a 15-foot building setback from buffers.

Site Photographs

Photo 1. View north along the northern portion of the biofiltration swale on the property (6/13/18).

Photo 2. View north along the biofiltration swale at the south end of the property (6/13/18).

Site Photographs

Photo 3. View west into Wetland A from the biofiltration swale near the south end of the property (6/13/18).

Photo 4. View southwest into Wetland A from near the northwest side of the wetland (6/13/18).

Site Photographs

Photo 5. View west into upland area between Wetlands A and B (6/13/18).

Photo 6. View west across the south end of Wetland B from the east side of the wetland (6/13/18).

Site Photographs

Photo 7. View south into Wetland B from the north edge of the wetland (6/13/18).

Photo 8. View northwest into Wetland D from the southeast side of the wetland (6/13/18).

Site Photographs

Photo 9. View north along the upland slope on the northeast side of the property (6/13/18).

Photo 10. View south along the upland slope in the southeast portion of the property (6/13/18).

Appendix C
Wetland Data Forms

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: Barkley Meadows City/County: Bellingham Sampling Date: 6-13-18
 Applicant/Owner: Dominican Sustainable Devel. Corp. State: WA Sampling Point: DP-1
 Investigator(s): E. Miller, L. Hansen Section, Township, Range: Sec 16, T38N, R03E
 Landform (hillslope, terrace, etc.): Hillslope Local relief (concave, convex, none): concave Slope (%): 2%
 Subregion (LRR): A Lat: _____ Long: _____ Datum: _____
 Soil Map Unit Name: _____ NWI classification: PFO, w, t

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☒ No ☐ (If no, explain in Remarks.)
 Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐
 Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes ☒ No ☐	Is the Sampled Area within a Wetland? Yes ☒ No ☐
Hydric Soil Present? Yes ☒ No ☐	
Wetland Hydrology Present? Yes ☒ No ☐	
Remarks: <u>Wetland A, in south half of site, near south prop line, N70' west of bioswale</u>	

VEGETATION – Use scientific names of plants.

Wetland name or number A

Maps and figures required to answer questions correctly for Western Washington

Depressional Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	D 1.3, H 1.1, H 1.4	1
Hydroperiods	D 1.4, H 1.2	3
Location of outlet (can be added to map of hydroperiods)	D 1.4, D 4.1	3
Boundary of area within 150 ft of the wetland (can be added to another figure)	D 2.2, D 5.2	2
Map of the contributing basin	D 4.3, D 5.3	2
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	1
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	D 3.1, D 3.2	4
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	D 3.3	5

Riverine Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Ponded depressions	R 1.1	
Boundary of area within 150 ft of the wetland (can be added to another figure)	R 2.4	
Plant cover of trees, shrubs, and herbaceous plants	R 1.2, R 4.2	
Width of unit vs. width of stream (can be added to another figure)	R 4.1	
Map of the contributing basin	R 2.2, R 2.3, R 5.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	R 3.1	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	R 3.2, R 3.3	

Lake Fringe Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	L 1.1, L 4.1, H 1.1, H 1.4	
Plant cover of trees, shrubs, and herbaceous plants	L 1.2	
Boundary of area within 150 ft of the wetland (can be added to another figure)	L 2.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	L 3.1, L 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	L 3.3	

Slope Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Plant cover of dense trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of dense, rigid trees, shrubs, and herbaceous plants (can be added to figure above)	S 4.1	
Boundary of 150 ft buffer (can be added to another figure)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

Wetland Rating System for Western WA: 2014 Update
Rating Form - Effective January 1, 2015

2

Wetland name or number 1A

HGM Classification of Wetlands in Western Washington

For questions 1-7, the criteria described must apply to the entire unit being rated.

If the hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1-7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

(NO) - go to 2 YES - the wetland class is Tidal Fringe - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

NO - Saltwater Tidal Fringe (Estuarine)

YES - Freshwater Tidal Fringe
If your wetland can be classified as a Freshwater Tidal Fringe use the forms for Riverine wetlands. If it is Saltwater Tidal Fringe it is an Estuarine wetland and is not scored. This method cannot be used to score functions for estuarine wetlands.

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

(NO) - go to 3

YES - The wetland class is Flats
If your wetland can be classified as a Flats wetland, use the form for Depressional wetlands.

3. Does the entire wetland unit meet all of the following criteria?

The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

At least 30% of the open water area is deeper than 6.6 ft (2 m).

(NO) - go to 4

YES - The wetland class is Lake Fringe (Lacustrine Fringe)

4. Does the entire wetland unit meet all of the following criteria?

The wetland is on a slope (slope can be very gradual).

The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.

The water leaves the wetland without being impounded.

(NO) - go to 5

YES - The wetland class is Slope

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit meet all of the following criteria?

The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river;

The overbank flooding occurs at least once every 2 years.

Wetland name or number _____

(NO) - go to 6

YES - The wetland class is Riverine
NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? This means that any outlet, if present, is higher than the interior of the wetland.

(NO) - go to 7

YES - The wetland class is Depressional

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

(NO) - go to 8

YES - The wetland class is Depressional

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit, classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream	Depressional
Within boundary of depression	
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have more than 2 HGM classes within a wetland boundary, classify the wetland as Depressional for the rating.

Wetland name or number A

DEPRESSIONAL AND FLATS WETLANDS	
Water Quality Functions - Indicators that the site functions to improve water quality	
D 1.0. Does the site have the potential to improve water quality?	
D 1.1. Characteristics of surface water outflows from the wetland: Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet). Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet. Wetland has an unconnected, or slightly constricted, surface outlet that is permanently flowing outlet. Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch. Wetland has an unconnected, or slightly constricted, surface outlet that is permanently flowing with no outlet, measure from the surface of permanent water or if dry, the deepest part. Marks of ponding are 3 ft or more above the surface or bottom of outlet. Marks are at least 0.5 ft to < 3 ft from surface or bottom of outlet. The wetland is a "headwater" wetland. Wetland is flat but has small depressions on the surface that trap water. Marks of ponding less than 0.5 ft (5 in). D 1.2. The soil is below the surface (or duff layer) is true clay or true organic (see NRCS definitions). Yes = 4, No = 0 D 1.3. Characteristics and distribution of persistent plants (Emergent, scrub-shrub, and/or Forested Cowardin classes): Wetland has persistent, ungrazed, plants > 95% of area Wetland has persistent, ungrazed, plants > 1/2 of area Wetland has persistent, ungrazed plants < 1/2 of area D 1.4. Characteristics of seasonal ponding or inundation: This is the area that is ponded for at least 2 months. See description in manual. Area seasonally ponded is > 1/2 total area of wetland Area seasonally ponded is < 1/2 total area of wetland Total for D 1	points = 3 points = 2 points = 1 points = 1 points = 4 points = 3 points = 1 points = 0 points = 4 points = 2 points = 0
Rating of Site Potential If score is: 12-16 = H, 6-11 = M, 0-5 = L	Add the points in the boxes above
D 2.0. Does the landscape have the potential to support the water quality function of the site?	
D 2.1. Does the wetland unit receive stormwater discharges?	
D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	Yes = 1, No = 0
D 2.3. Are there septic systems within 250 ft of the wetland?	Yes = 1, No = 0
D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1-D 2.3?	Yes = 1, No = 0
Source	
Total for D 2	
Rating of Landscape Potential If score is: 3 or 4 = H, 1 or 2 = M, 0 = L	Add the points in the boxes above
D 3.0. Is the water quality improvement provided by the site valuable to society?	
D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list?	
D 3.2. Is the wetland in a basin or sub-basin where an aquatic resource is on the 303(d) list?	Yes = 1, No = 0
D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (answer YES if there is a TMDL for the basin in which the unit is found)?	Yes = 1, No = 0
Total for D 3	
Rating of Value If score is: 2-4 = H, 1 = M, 0 = L	Add the points in the boxes above

3.2- Wetland Creek basin- Four Creek has 303(d) listing
3.3- TMDL in Wetland Creek watershed.

Wetland name or number A

DEPRESSIONAL AND FLATS WETLANDS	
Hydrologic Functions - Indicators that the site functions to reduce flooding and stream degradation	
D 4.0. Does the site have the potential to reduce flooding and erosion?	
D 4.1. Characteristics of surface water outflows from the wetland: Wetland is a depression or flat depression with no surface water leaving it (no outlet). Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet. Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch. Wetland has an unconnected, or slightly constricted, surface outlet that is permanently flowing with no outlet, measure from the surface of permanent water or if dry, the deepest part. Marks of ponding are 3 ft or more above the surface or bottom of outlet. Marks are at least 0.5 ft to < 3 ft from surface or bottom of outlet. The wetland is a "headwater" wetland. Wetland is flat but has small depressions on the surface that trap water. Marks of ponding less than 0.5 ft (5 in). D 4.2. Depth of storage during wet periods: Estimate the ratio of the area of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part. Marks of ponding are 3 ft or more above the surface or bottom of outlet. Marks are at least 0.5 ft to < 3 ft from surface or bottom of outlet. The wetland is a "headwater" wetland. Wetland is flat but has small depressions on the surface that trap water. Marks of ponding less than 0.5 ft (5 in). D 4.3. Contribution of the wetland to storage in the watershed: Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself. The area of the basin is less than 10 times the area of the unit. The area of the basin is 10 to 100 times the area of the unit. The area of the basin is more than 100 times the area of the unit. Entire wetland is in the Flats class Total for D 4	points = 4 points = 2 points = 1 points = 0 points = 7 points = 5 points = 3 points = 1 points = 0 points = 5 points = 3 points = 0 points = 5
Rating of Site Potential If score is: 12-16 = H, 6-11 = M, 0-5 = L	Add the points in the boxes above
D 5.0. Does the landscape have the potential to support hydrologic functions of the site?	
D 5.1. Does the wetland receive stormwater discharges?	
D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff?	Yes = 1, No = 0
D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land use (residential at > 1 residence/acre, urban, commercial, agriculture, etc.)?	Yes = 1, No = 0
Source	
Total for D 5	
Rating of Landscape Potential If score is: 3 or 4 = H, 1 or 2 = M, 0 = L	Add the points in the boxes above
D 6.0. Are the hydrologic functions provided by the site valuable to society?	
D 6.1. The unit is in a landscape that has flooding problems. Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met. The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds). Flooded human or natural resources are in a sub-basin that is immediately down-gradient of unit. Flooding from groundwater is an issue in the sub-basin. The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why. There are no problems with flooding downstream of the wetland. D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	points = 2 points = 1 points = 1 points = 0 points = 0 Yes = 2, No = 0
Total for D 6	
Rating of Value If score is: 2-4 = H, 1 = M, 0 = L	Add the points in the boxes above

Wetland name or number _____

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS	
Hydrologic Functions - Indicators that site functions to reduce flooding and stream erosion	
R 4.0. Does the site have the potential to reduce flooding and erosion?	
R 4.1. Characteristics of the overbank storage the wetland provides: Estimate the average width of the wetland perpendicular to the direction of the flow and the width of the stream or river channel (distance between banks). Calculate the ratio: (average width of wetland)/(average width of stream between banks). If the ratio is more than 20 points = 9 If the ratio is 10-20 points = 6 If the ratio is 5-10 points = 4 If the ratio is 1-4 points = 2 If the ratio is < 1 points = 1	
R 4.2. Characteristics of plants that slow down water velocities during floods. Treat large woody debris as forest or shrub. Choose the points appropriate for the best description (polygons need to have >90% cover at person height. These are NOT Cowardin classes). Forest or shrub for > 1/2 area OR emergent plants > 1/2 area points = 7 Forest or shrub for > 1/4 area OR emergent plants > 1/4 area points = 4 Plants do not meet above criteria points = 0	
Total for R 4 _____ Add the points in the boxes above _____	
Rating of Site Potential If score is: 12-16 = H 6-11 = M 0-5 = L	
R 5.0. Does the landscape have the potential to support the hydrologic functions of the site?	
R 5.1. Is the stream or river adjacent to the wetland downcut? Yes = 0, No = 1 R 5.2. Does the up-gradient watershed include a UGA or Incorporated area? Yes = 1, No = 0 R 5.3. Is the up-gradient stream or river controlled by dams? Yes = 0, No = 1	
Total for R 5 _____ Add the points in the boxes above _____	
Rating of Landscape Potential If score is: 3 = H 1 or 2 = M 0 = L	
R 6.0. Are the hydrologic functions provided by the site valuable to society?	
R 6.1. Distance to the nearest areas downstream that have flooding problems? Choose the description that best fits the site. The sub-basin immediately down-gradient of the wetland has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds) points = 2 Surface flooding problems are in a sub-basin farther down-gradient points = 1 No flooding problems anywhere downstream points = 0	
R 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2, No = 0	
Total for R 6 _____ Add the points in the boxes above _____	
Rating of Value If score is: 2-4 = H 1 = M 0 = L	

Record the rating on the first page

Wetland name or number B

These questions apply to wetlands of all HGM classes. Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of 1/4 ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.

☒ Aquatic bed

☒ Emergent

☒ Shrub-shrub (areas where shrubs have > 30% cover)

☒ Forested (areas where trees have > 30% cover)

☒ If the unit has a Forested class, check if:

☒ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or 1/4 ac to count (see text for descriptions of hydroperiods).

☒ Permanently flooded or inundated

☒ Seasonally flooded or inundated

☒ Occasionally flooded or inundated

☒ Saturated only

☒ Permanently flowing stream or river in, or adjacent to, the wetland

☒ Seasonally flowing stream in, or adjacent to, the wetland

☒ Late fringe wetland

☒ Freshwater tidal wetland

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle

If you counted: > 19 species

5 - 19 species

< 5 species

H 1.4. Interpenetration of habitats

Decide from the diagrams below whether interpenetration among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. (If you have four or more plant classes or three classes and open water, the rating is always high.)

None = 0 points

Low = 1 point

Moderate = 2 points

All three diagrams in the row are HIGH = 3 points

2

Wetland Rating System for Western WA: 2014 Update
Rating Form - Effective January 1, 2015

13

Wetland name or number A

H 1.5. Special habitat features

Check the habitat features that are present in the wetland. The number of checks is the number of points.

☒ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long).

☒ Standing snags (dbh > 4 in) within the wetland

☒ Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m)

☒ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degrees slope) OR signs of recent beaver activity are present (cut shrubs or trees that have not yet weathered where wood is exposed)

☒ At least 1/4 ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (structures for egg-laying by amphibians)

☒ Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)

Total for H 1.5

Rating of Site Potential: If score is: 15-18 = H 7-14 = M 0-6 = L

H 2.0. Does the landscape have the potential to support the habitat functions of the site?

H 2.1. Accessible habitat (include only habitat that directly abuts wetland unit).

Calculate: % undisturbed habitat $\frac{1}{100} \times 100 = 1\%$ (moderate and low intensity land uses) $\frac{1}{200} \times 100 = 0.5\%$

If total accessible habitat is:

> 1/4 (33.3%) of 1 km Polygon

20-33% of 1 km Polygon

10-19% of 1 km Polygon

< 10% of 1 km Polygon

H 2.2. Undisturbed habitat in 1 km Polygon around the wetland.

Calculate: % undisturbed habitat $\frac{2}{100} \times 100 = 2\%$ (moderate and low intensity land uses) $\frac{1}{200} \times 100 = 0.5\%$

Undisturbed habitat > 50% of Polygon

Undisturbed habitat 10-50% and in 1-3 patches

Undisturbed habitat 10-50% and > 3 patches

Undisturbed habitat < 10% of 1 km Polygon

H 2.3. Land use intensity in 1 km Polygon: If

> 50% of 1 km Polygon is high intensity land use

< 50% of 1 km Polygon is high intensity

Total for H 2

Rating of Landscape Potential: If score is: 4-6 = H 1-3 = M < 1 = L

H 3.0. Is the habitat provided by the site valuable to society?

H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.

Site meets ANY of the following criteria:

It has 3 or more priority habitats within 100 m (see next page)

It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists)

It is mapped as a location for an individual WDFW priority species

It is a Wetland of High Conservation Value as determined by the Department of Natural Resources

Shoreline Master Plan, or in a watershed plan

Site has 1 or 2 priority habitats (listed on next page) within 100 m

Site does not meet any of the criteria above

Rating of Value: If score is: 2 = H 1 = M 0 = L

1

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
Check off any criteria that apply to the wetland. Circle the category when the appropriate criteria are met.	
SC 1.0. Estuarine wetlands Does the wetland meet the following criteria for Estuarine wetlands? — The dominant water regime is tidal, — Vegetated, and — With a salinity greater than 0.5 ppt	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 93A-20-1512?	Cat. I Yes = Category 1 No = Go to SC 1.2
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? — The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. If non-native species are <i>Spartina</i> , see page 28) — At least ¼ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or unmowed grassland. — The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.	Cat. I Yes = Category 1 No = Category II
SC 2.0. Wetlands of High Conservation Value (WHCV)	
SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?	Cat. I Yes = Go to SC 2.2 No = Go to SC 2.3
SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?	Cat. I Yes = Category I No = Not a WHCV
SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? https://www.dnr.wa.gov/nhp/research/wetlands.pdf	Cat. I Yes = Contract WHCV/WDNR and go to SC 2.4 No = Not a WHCV
SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?	Cat. I Yes = Category I No = Not a WHCV
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? Use the key below. If you answer YES you will need to rate the wetland based on its functions.	
SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that comprise 16 in or more of the first 32 in of the soil profile?	Cat. I Yes = Go to SC 3.2 No = Go to SC 3.3
SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?	Cat. I Yes = Go to SC 3.3 No = Is not a bog
SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?	Cat. I Yes = Is a Category I bog No = Go to SC 3.4
NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.	
SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 20% of the cover under the canopy?	Cat. I Yes = Is a Category I bog No = Is not a bog

97

Wetland Rating System for Western WA: 2014 Update
Rating Form - Effective January 1, 2015

WDFW Priority Habitats

Priorities habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife, 2008, Priority Habitat and Species List Olympia, Washington, 177 pp. <http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here: <http://wdfw.wa.gov/conservation/pubs/list.asp>).

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit. **NOTE:** This question is independent of the land use between the wetland unit and the priority habitat.

A mean stand of 1000 involved stands of aspen greater than 1 ac (0.4 ha).

↙ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife. (Full descriptions in WDFW PHS reports).

variable clay patches of amaranth and forbs on shallow soils over bedrock

Old-growth / Mature forests - Old-growth west of Cascade crest - Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees / ac [20 trees / ha, ≥ 32 in (81 cm) dbh or > 200 years of age. Mature forests - Stands with average diameters exceeding 24 in (52 cm) dbh; crown cover may be less than 100% decay, decadence, numbers of snags and quantity of large downed material is generally less than that found in old-growth; 80-200 years old, west of the Cascade crest.

Oregon White Oak: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak

Riparian: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems and mutually influence each other.

Westside Prairies: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie. *(Full descriptions in WDSW PHS report n. 161 – see web link above).*

Instrument: The combination of physical, biological, and chemical processes and conditions that interact to provide for and control life. *See also* 1166. **Intersecting requirements for instream fish and wildlife resources.**

— **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (full descriptions of habitats and the definition of relatively undisturbed are in WDFW report - see web link on previous page).

Cavess: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rocks, ice, or other material formations and is large enough to contain a human.

concentrations below 5000 ft elevation.

— **Talus:** Homogeneous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and felsic volcanic rocks, including rhyolite cliffs and mine millings. May be associated with cliffs.

Snags and Logs: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

Wetland name or number 2

Wetland name or number _____

This page left blank intentionally

SC 4.0. Forested Wetlands Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? If you answer YES you will still need to rate the wetland based on its functions. - Old-growth forests (west of Cascade crest); Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/acre (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 82 in (81 cm) or more. - Mature forests (west of the Cascade Crest); Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm). Yes = Category I No = Not a forested wetland for this section	SC 5.0. Wetlands in Coastal Lagoons Does the wetland meet all of the following criteria of a wetland in a coastal lagoon? - The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks - The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (needs to be measured near the bottom) Yes - Go to SC 5.1 No - Not a wetland in a coastal lagoon SC 5.1. Does the wetland meet all of the following three conditions? - The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grading), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100). - At least 1/2 of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. - The wetland is larger than 1/2 acre (4350 ft²) Yes = Category I No = Category II	SC 6.0. Intertidal Wetlands Is the wetland west of the 1899 line (also called the Western Boundary of Upland Ownership or WBUD)? If you answer yes you will still need to rate the wetland based on its habitat functions. - Long Beach Peninsula: Lands west of SR 103 - Grayland-Westport: Lands west of SR 105 - Ocean Shores-Copalis: Lands west of SR 115 and SR 109 Yes - Go to SC 6.1 No - Not an intertidal wetland for rating SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H₁, H₂, H₃ or H₄, H₅ M for the three aspects of function)? Yes = Category I No - Go to SC 6.2 SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger? Yes = Category II No - Go to SC 6.3 SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac? Yes = Category III No = Category IV	Category of wetland based on Special Characteristics If you answered No for all types, enter "Not Applicable" on Summary Form Cat. I Cat. II Cat. III Cat. IV <u>NA</u>

Wetland name or number B

HGM Classification of Wetlands in Western Washington

For questions 1-7, the criteria described must apply to the entire unit being rated.

If the hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1-7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☒ NO - go to 2

YES - the wetland class is Tidal Fringe - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

NO - Saltwater Tidal Fringe (Estuarine)

YES - Freshwater Tidal Fringe
If your wetland can be classified as a Freshwater Tidal Fringe use the forms for Riverine wetlands. If it is Saltwater Tidal Fringe it is an Estuarine wetland and is not scored. This method cannot be used to score functions for estuarine wetlands.

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

☒ NO - go to 3

YES - The wetland class is Flats
If your wetland can be classified as a Flats wetland, use the form for Depressional wetlands.

3. Does the entire wetland unit meet all of the following criteria?

The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
At least 30% of the open water area is deeper than 6.6 ft (2 m).

☒ NO - go to 4

YES - The wetland class is Lake Fringe (Lacustrine Fringe)

4. Does the entire wetland unit meet all of the following criteria?

The wetland is on a slope (slope can be very gradual).
The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
The water leaves the wetland without being impounded.

☒ NO - go to 5

YES - The wetland class is Slope

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit meet all of the following criteria?

The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river.
The overbank flooding occurs at least once every 2 years.

Wetland name or number _____

☒ NO - go to 6

YES - The wetland class is Riverine
NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? This means that any outlet, if present, is higher than the interior of the wetland.

☒ NO - go to 7

YES - The wetland class is Depressional

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☒ NO - go to 8

YES - The wetland class is Depressional

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit, classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream	Depressional
Within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have more than 2 HGM classes within a wetland boundary, classify the wetland as Depressional for the rating.

Wetland name or number B

DEPRESSIONAL AND FLATS WETLANDS	
D 1.0. Does the site have the potential to improve water quality?	
D 1.1. Characteristics of surface water outflows from the wetland: Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet). Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet.	2
D 1.2. The wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch. D 1.3. Characteristics and distribution of persistent plants (Emergent, scrub-shrub, and/or Forested Cowardin classes): Wetland has persistent, ungrazed, plants > 95% of area Wetland has persistent, ungrazed, plants > 1/2 of area Wetland has persistent, ungrazed, plants < 1/2 of area	0
D 1.4. Characteristics of seasonal ponding or inundation: This is the area that is ponded for at least 2 months. See description in manual. Area seasonally ponded is > 1/2 total area of wetland Area seasonally ponded is < 1/2 total area of wetland	5
Total for D 1	2
Rating of Site Potential If score is: 12-16 = H, 6-11 = M, 0-5 = L	2
D 2.0. Does the landscape have the potential to support the water quality function of the site? D 2.1. Does the wetland unit receive stormwater discharges? D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants? D 2.3. Are there septic systems within 250 ft of the wetland? D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1-D 2.3? Source: _____ Total for D 2	1
Rating of Landscape Potential If score is: 3 or 4 = H, 1 or 2 = M, 0 = L	1
D 3.0. Is the water quality improvement provided by the site valuable to society? D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 903(d) list? D 3.2. Is the wetland in a basin or sub-basin where an aquifer resource is on the 903(d) list? D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (answer YES if there is a TMDL for the basin in which the unit is found)? Total for D 3	0
Rating of Value If score is: 1/2-4 = H, 1 = M, 0 = L	3

3.2. Whatcom Creek basin Farer Creek 303(d) list
3.3. Whatcom Creek was TMDL

Wetland Rating System for Western WA: 2014 Update
Rating Form - Effective January 1, 2015

Wetland name or number B

DEPRESSIONAL AND FLATS WETLANDS	
D 4.0. Does the site have the potential to reduce flooding and stream degradation?	
D 4.1. Characteristics of surface water outflows from the wetland: Wetland is a depression or flat depression with no surface water leaving it (no outlet). Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet. Wetland has a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch. Wetland has an unconfined, or slightly constricted, surface outlet that is permanently flowing. D 4.2. Depth of stream during wet periods. Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or, if dry, the deepest part. Marks of ponding are 3 ft or more above the surface or bottom of outlet. Marks are at least 0.5 ft to < 3 ft from surface or bottom of outlet. The wetland is a "headwater" wetland. Wetland is flat but has small depressions on the surface that trap water. Marks of ponding less than 0.5 ft (6 in). D 4.3. Contribution of the wetland to storage in the watershed. Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself. The area of the basin is less than 10 times the area of the unit. The area of the basin is 10 to 100 times the area of the unit. The area of the basin is more than 100 times the area of the unit. Entire wetland is in the Flats class Total for D 4	2
Rating of Site Potential If score is: 12-16 = H, 6-11 = M, 0-5 = L	2
D 5.0. Does the landscape have the potential to support hydrologic functions of the site? D 5.1. Does the wetland receive stormwater discharges? D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff? D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential, > 1 residence/ac, urban, commercial, agriculture, etc.)? Total for D 5	1
Rating of Landscape Potential If score is: 3 = H, 1 or 2 = M, 0 = L	1
D 6.0. Are the hydrologic functions provided by the site valuable to society? D 6.1. The unit is in a landscape that has flooding problems. Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met. The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds). Flooded occurs in a sub-basin that is immediately down-gradient of unit. Flooded from groundwater is an issue in the sub-basin. The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why _____ There are no problems with flooding downstream of the wetland. D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Total for D 6	0
Rating of Value If score is: 2-4 = H, 1 = M, 0 = L	0

Wetland Rating System for Western WA: 2014 Update
Rating Form - Effective January 1, 2015

Wetland name or number _____

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS	
Water Quality Functions - Indicators that the site functions to improve water quality	
R 1.0. Does the site have the potential to improve water quality?	
R 1.1. Area of surface depressions within the Riverine wetland that can trap sediments during a flooding event: Depressions cover > 3/4 area of wetland points = 8 Depressions cover > 1/2 area of wetland points = 4 Depressions present but cover < 1/2 area of wetland points = 2 No depressions present points = 0	
R 1.2. Structure of plants in the wetland (areas with >90% cover at person height, not Cowardin classes): Trees or shrubs > 3/4 area of the wetland points = 8 Trees or shrubs > 1/2 area of the wetland points = 6 Herbaceous plants (> 6 in high) > 3/4 area of the wetland points = 6 Herbaceous plants (> 6 in high) > 1/2 area of the wetland points = 3 Trees, shrubs, and ungrazed herbaceous < 1/4 area of the wetland points = 0	
Total for R 1 _____	
Rating of Site Potential If score is: 12-16 = H 6-11 = M 0-5 = L	
Record the rating on the first page	
R 2.0. Does the landscape have the potential to support the water quality function of the site?	
R 2.1. Is the wetland within an incorporated city or within its UGA? Yes = 2 No = 0 R 2.2. Does the contributing basin to the wetland include a UGA incorporated area? Yes = 1 No = 0 R 2.3. Does at least 10% of the contributing basin contain tilled fields, pastures, or forests that have been cleared within the last 5 years? Yes = 1 No = 0 R 2.4. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants? Yes = 1 No = 0 R 2.5. Are there other sources of pollutants coming into the wetland that are not listed in questions R 2.1-R 2.4? Yes = 1 No = 0	
Total for R 2 _____	
Rating of Landscape Potential If score is: 3-6 = H 1-2 = M 0 = L	
Record the rating on the first page	
R 3.0. Is the water quality improvement provided by the site valuable to society?	
R 3.1. Is the wetland along a stream or river that is on the SOC(d) list or on a tributary that drains to one within 1 mi? Yes = 1 No = 0 R 3.2. Is the wetland along a stream or river that has TWMDL limits for nutrients, toxics, or pesticides? Yes = 1 No = 0 R 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? (answer YES if there is a TWMDL for the drainage in which the unit is found) Yes = 2 No = 0	
Total for R 3 _____	
Rating of Value If score is: 2-4 = H 1 = M 0 = L	
Record the rating on the first page	

Wetland name or number _____

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS	
Hydrologic Functions - Indicators that site functions to reduce flooding and stream erosion	
R 4.0. Does the site have the potential to reduce flooding and erosion?	
R 4.1. Characteristics of the overbank storage the wetland provides: Estimate the average width of the wetland perpendicular to the direction of the flow and the width of the stream or river channel (distance between banks). Calculate the ratio: (average width of wetland)/(average width of stream between banks). If the ratio is more than 20 points = 9 If the ratio is 10-20 points = 6 If the ratio is 5-10 points = 4 If the ratio is 1-4 points = 2 If the ratio is < 1 points = 1	
R 4.2. Characteristics of plants that slow down water velocities during floods. Treat large woody debris as forest or shrub. Choose the points appropriate for the best description (polygons need to have >90% cover at person height. These are NOT Cowardin classes). Forest or shrub for > 3/4 area OR emergent plants > 3/4 area points = 7 Forest or shrub for > 1/4 area OR emergent plants > 1/4 area points = 4 Plants do not meet above criteria points = 0	
Total for R 4 _____	
Rating of Site Potential If score is: 12-16 = H 6-11 = M 0-5 = L	
Record the rating on the first page	
R 5.0. Does the landscape have the potential to support the hydrologic functions of the site?	
R 5.1. Is the stream or river adjacent to the wetland downcut? Yes = 0 No = 1 R 5.2. Does the up-gradient watershed include a UGA or incorporated area? Yes = 1 No = 0 R 5.3. Is the up-gradient stream or river controlled by dams? Yes = 0 No = 1	
Total for R 5 _____	
Rating of Landscape Potential If score is: 3 = H 1 or 2 = M 0 = L	
Record the rating on the first page	
R 6.0. Are the hydrologic functions provided by the site valuable to society?	
R 6.1. Disturbance to the nearest areas downstream that have flooding problems? Choose the description that best fits the site. The sub-basin immediately down-gradient of the wetland has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds) points = 2 Surface flooding problems are in a sub-basin further down-gradient points = 1 No flooding problems anywhere downstream points = 0	
R 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0	
Total for R 6 _____	
Rating of Value If score is: 2-4 = H 1 = M 0 = L	
Record the rating on the first page	

Wetland name or number B

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: Indicators are Cowardin classes and strata within the Forested class. Check the following plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of 1/4 ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.

☒ Aquatic bed

☒ Emergent

☒ Scrub-shrub (areas where shrubs have > 90% cover)

☒ Forested (areas where trees have > 90% cover)

☒ If the unit has a Forested class, check if:

☒ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or 1/4 ac to count (see text for descriptions of hydroperiods).

☒ Permanently flooded or inundated

☒ Seasonally flooded or inundated

☒ Saturated only

☒ Permanently flowing stream or river in, or adjacent to, the wetland

☒ Seasonally flowing stream in, or adjacent to, the wetland

☒ Lake Fringe wetland

☒ Freshwater tidal wetland

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle if you counted > 19 species

5 - 19 species points = 2

< 5 species points = 1

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersions among Cowardin plant classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. If you have four or more plant classes or three classes and open water, the rating is always high.

None = 0 points

Low = 1 point

Moderate = 2 points

All three diagrams in the row are HIGH = 3 points

Wetland Rating System for Western WA: 2014 Update
Rating Form - Effective January 1, 2015

13

Wetland name or number B

H 1.5. Special habitat features:

Check the habitat features that are present in the wetland. The number of checks is the number of points.

☒ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long).

☒ Standing snags (dbh > 4 in) within the wetland

☒ Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m)

☒ Stable steep banks of fine material that might be used by beaver or muskrat for damming (> 50 degree slope) OR signs of recent beaver activity are present (cut shrubs or trees that have not yet weathered where wood is exposed)

☒ At least 1/2 ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (structures for egg-laying by amphibians)

☒ Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)

Total for H 1.5

Rating of Site Potential If score is: 15-18 = H 7-14 = M 0-6 = L

H 2.0. Does the landscape have the potential to support the habitat functions of the site?

H 2.1. Accessible habitat (include only habitat that directly abuts wetland unit).

Calculate: % undisturbed habitat $\frac{27}{100} = 27\%$

If total accessible habitat is:

> 1/4 (33.3%) of 1 km Polygon points = 3

20-33% of 1 km Polygon points = 2

10-19% of 1 km Polygon points = 1

< 10% of 1 km Polygon points = 0

H 2.2. Undisturbed habitat in 1 km Polygon around the wetland.

Calculate: % undisturbed habitat $\frac{27}{100} = 27\%$

Undisturbed habitat > 50% of Polygon points = 3

Undisturbed habitat 40-50% and in 1-3 patches points = 2

Undisturbed habitat 10-50% and > 3 patches points = 1

Undisturbed habitat < 10% of 1 km Polygon points = 0

H 2.3. Land use intensity in 1 km Polygon: if

> 50% of 1 km Polygon is high intensity land use points = 1

≤ 50% of 1 km Polygon is high intensity points = 0

Total for H 2

Rating of Landscape Potential If score is: 4-6 = H 1-3 = M 0-1 = L

H 3.0. Is the habitat provided by the site valuable to society?

H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.

Site meets ANY of the following criteria:

— It has 3 or more priority habitats within 100 m (see next page)

— It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists)

— It is mapped as a location for an individual WDFW priority species

— It is a Wetland of High Conservation Value as determined by the Department of Natural Resources Shoreline Master Plan, or in a watershed plan

Site has 1 or 2 priority habitats (listed on next page) within 100 m

Site does not meet any of the criteria above points = 0

Rating of Value If score is: 2 = H 1 = M 0 = L

This page left blank intentionally

SC 4.0. Forested Wetlands Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? If you answer YES you will still need to rate the wetland based on its functions. - Old-growth forest (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings with at least 8 trees/acre (20 trees/hectare) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more. - Mature forests (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm). Yes = Category I No = Not a forested wetland for this section	Cat. I
SC 5.0. Wetlands in Coastal Lagoons Does the wetland meet all of the following criteria of a wetland in a coastal lagoon? - The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbars, gravel banks, shingle or, less frequently, rocks - The lagoon in which the wetland is located contains ponded water that is saline or brackish (>0.5 ppt) during most of the year in at least a portion of the lagoon (needs to be measured near the bottom) Yes - Go to SC 5.1 No - Not a wetland in a coastal lagoon SC 5.1. Does the wetland meet all of the following three conditions? - The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100). - At least 1/4 of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. - The wetland is larger than 1/4 acre (4350 ft²) Yes = Category I No = Category II	Cat. I Cat. II
SC 6.0. Intertidal Wetlands Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBEO)? If you answer yes you will still need to rate the wetland based on its habitat functions. - Long Beach Peninsula: Lands west of SR 108 - Grayland-Wesport: Lands west of SR 105 - Ocean Shore-Copalis: Lands west of SR 115 and SR 109 Yes - Go to SC 6.1 No = not an intertidal wetland for rating SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H₁, H₂, H₃ or H₄, H₅, H₆) for the three aspects of function? SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger? Yes = Category I No - Go to SC 6.2 SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac? Yes = Category II No - Go to SC 6.3 Yes = Category III No = Category IV	Cat. I Cat. II Cat. III Cat. IV
Category of wetland based on Special Characteristics If you answered No for all types, enter "Not Applicable" on Summary Form	NA

Wetland Rating System for Western WA: 2014 Update
Rating Form – Effective January 1, 2015

2

Wetland name or number D

HGM Classification of Wetlands in Western Washington

For questions 1-7, the criteria described must apply to the entire unit being rated.

If the hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1-7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

NO - go to 2

YES - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

NO - Saltwater Tidal Fringe (Estuarine)

YES - Freshwater Tidal Fringe
If your wetland can be classified as a Freshwater Tidal Fringe use the forms for Riverine wetlands. If it is Saltwater Tidal Fringe it is an Estuarine wetland and is not scored. This method cannot be used to score functions for estuarine wetlands.

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

NO - go to 3

YES - The wetland class is **Flats**
If your wetland can be classified as a Flats wetland, use the form for Depressional wetlands.

3. Does the entire wetland unit meet all of the following criteria?

- ☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
- ☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

NO - go to 4

YES - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit meet all of the following criteria?

- ☐ The wetland is on a slope (slope can be very gradual);
- ☒ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks;
- ☒ The water leaves the wetland without being impounded.

NO - go to 5

YES - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit meet all of the following criteria?

- ☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river;
- ☐ The overbank flooding occurs at least once every 2 years.

Wetland name or number D

NO - go to 6

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? This means that any outlet, if present, is higher than the interior of the wetland.

NO - go to 7

YES - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

NO - go to 8

YES - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have more than 2 HGM classes within a wetland boundary, classify the wetland as Depressional for the rating.

Wetland name or number _____

LAKE FRINGE WETLANDS	
Water Quality Functions -- Indicators that the site functions to improve water quality	
L 1.0. Does the site have the potential to improve water quality?	
L 1.1. Average width of plants along the lakeshore (use polygons of Cowardin classes): Plants are more than 33 ft (10 m) wide Plants are more than 16 ft (5 m) wide and <33 ft Plants are more than 6 ft (2 m) wide and <16 ft Plants are less than 6 ft wide	points = 6 points = 3 points = 1 points = 0
L 1.2. Characteristics of the plants in the wetland: Choose the appropriate description that results in the highest points, and do not include any open water in your estimate of coverage. The herbaceous plants can be either the dominant form or as an understorey in a shrub or forest community. These are not Cowardin classes. Area of cover is total cover in the unit, but it can be in patches. Herbaceous does not include aquatic bed. Cover of herbaceous plants is >50% of the vegetated area Cover of herbaceous plants is >1/3 of the vegetated area Cover of herbaceous plants is >1/3 of the vegetated area Other plants that are not aquatic bed > 1/3 unit Other plants that are not aquatic bed > 1/3 vegetated area Aquatic bed plants and open water cover > 1/3 of the unit	points = 6 points = 4 points = 3 points = 3 points = 1 points = 0
Total for L 1	Add the points in the boxes above
Rating of Site Potential: If score is: 3-12 = H 4-7 = M 0-3 = L	
Record the rating on the first page	
L 2.0. Does the landscape have the potential to support the water quality function of the site?	
L 2.1. Is the lake used by power boats?	Yes = 1 No = 0
L 2.2. Is > 10% of the area within 150 ft of wetland unit on the upland side in land uses that generate pollutants?	Yes = 1 No = 0
L 2.3. Does the lake have problems with algal blooms or excessive plant growth such as milfoil?	Yes = 1 No = 0
Total for L 2	Add the points in the boxes above
Rating of Landscape Potential: If score is: 2 or 3 = H 1 = M 0 = L	
Record the rating on the first page	
L 3.0. Is the water quality improvement provided by the site valuable to society?	
L 3.1. Is the lake on the 303(c) list of degraded aquatic resources?	Yes = 1 No = 0
L 3.2. Is the lake in a sub-basin where water quality is an issue (at least one aquatic resource in the basin is on the 303(d) list)?	Yes = 1 No = 0
L 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? Answer YES if there is a TMDL for the lake or basin in which the unit is found.	Yes = 2 No = 0
Total for L 3	Add the points in the boxes above
Rating of Value: If score is: 2-4 = H 1 = M 0 = L	
Record the rating on the first page	

Wetland name or number _____

LAKE FRINGE WETLANDS	
Hydrologic Functions -- Indicators that the wetland unit functions to reduce shoreline erosion	
L 4.0. Does the site have the potential to reduce shoreline erosion?	
L 4.1. Distance along shore and average width of Cowardin classes along the lakeshore (do not include Aquatic bed): Choose the highest scoring description that matches conditions in the wetland. > 1/2 of distance is Scrub-shrub or Forested at least 33 ft (10 m) wide > 1/4 of distance is Scrub-shrub or Forested at least 6 ft (2 m) wide > 1/4 of distance is Scrub-shrub or Forested at least 33 ft (10 m) wide Plants are at least 6 ft (2 m) wide (any type except Aquatic bed) Plants are less than 6 ft (2 m) wide (any type except Aquatic bed)	points = 6 points = 4 points = 4 points = 2 points = 0
Rating of Site Potential: If score is: 6 = M 0-5 = L	
Record the rating on the first page	
L 5.0. Does the landscape have the potential to support the hydrologic functions of the site?	
L 5.1. Is the lake used by power boats with more than 10 hp?	Yes = 1 No = 0
L 5.2. Is the fetch on the lake side of the unit at least 1 mile in distance?	Yes = 1 No = 0
Total for L 5	Add the points in the boxes above
Rating of Landscape Potential: If score is: 2 = H 1 = M 0 = L	
Record the rating on the first page	
L 6.0. Are the hydrologic functions provided by the site valuable to society?	
L 6.1. Are there resources along the shore that can be impacted by erosion? If more than one resource is present, choose the one with the highest score. There are human structures or old growth/mature forests within 25 ft of OHWM of the shore in the unit There are nature trails or other paths and recreational activities within 25 ft of OHWM Other resources that could be impacted by erosion There are no resources that can be impacted by erosion along the shores of the unit	points = 2 points = 1 points = 1 points = 0
Rating of Value: If score is: 2 = H 1 = M 0 = L	
Record the rating on the first page	

NOTES and FIELD OBSERVATIONS:

Wetland name or number D

SLOPE WETLANDS	
Water Quality Functions - Indicators that the site functions to improve water quality	
S 1.0. Does the site have the potential to improve water quality?	
S 1.1. Characteristics of the average slope of the wetland: (a 1% slope has a 1 ft vertical drop in elevation for every 100 ft of horizontal distance) Slope is 1% or less Slope is > 1%-2% Slope is > 2%-5% Slope is greater than 5%	0 points = 3 points = 2 points = 1 points = 0
S 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions): Yes = 3 No = 0	0
S 1.3. Characteristics of the plants in the wetland that trap sediments and pollutants: Choose the points appropriate for the description that best fits the plants in the wetland. Dense means you have trouble seeing the soil surface (>75% cover), and uncult means not grazed or mowed and plants are higher than 6 in. Dense, uncult, herbaceous plants > 90% of the wetland area Dense, uncult, herbaceous plants > 1/2 of area Dense, woody, plants > 1/2 of area Dense, uncult, herbaceous plants > 1/2 of area Does not meet any of the criteria above for plants	2 points = 6 points = 3 points = 2 points = 1 points = 0
Total for S 1	2
Rating of Site Potential If score is: 12 = H 6-11 = M 0-5 = L	2

S 2.0. Does the landscape have the potential to support the water quality function of the site?	
S 2.1. Is > 10% of the area within 150 ft on the uphill side of the wetland in land uses that generate pollutants? Yes = 1 No = 0	0
S 2.2. Are there other sources of pollutants coming into the wetland that are not listed in question S 2.1? Other sources: _____ Yes = 1 No = 0	0
Total for S 2	0
Rating of Landscape Potential If score is: 1-2 = M 0 = L	0

S 3.0. Is the water quality improvement provided by the site valuable to society?	
S 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list? Yes = 1 No = 0	0
S 3.2. Is the wetland in a basin or sub-basin where water quality is an issue? At least one aquatic resource in the basin is on the 303(d) list. Yes = 1 No = 0	1
S 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? Answer YES if there is a TMDL for the basin in which unit is found. Yes = 2 No = 0	2
Total for S 3	3
Rating of Value If score is: 2-4 = H 1 = M 0 = L	3

3.2 - Squalicum Creek listed for Bacteria + P.O.
3.3 - Squalicum Creek TMDL

Wetland name or number D

SLOPE WETLANDS	
Hydrologic Functions - Indicators that the site functions to reduce flooding and stream erosion	
S 4.0. Does the site have the potential to reduce flooding and stream erosion?	
S 4.1. Characteristics of plants that reduce the velocity of surface flows during storms: Choose the points appropriate for the description that best fits conditions in the wetland. Stems of plants should be thick enough (usually > 1/8 in), or dense enough, to remain erect during surface flows. Dense, uncult, rigid plants cover > 90% of the area of the wetland All other conditions	1 points = 1 points = 0
Rating of Site Potential If score is: 1 = M 0 = L	1
S 5.0. Does the landscape have the potential to support the hydrologic functions of the site?	
S 5.1. Is more than 25% of the area within 150 ft upslope of wetland in land uses or cover that generate excess surface runoff? Yes = 1 No = 0	0
Rating of Landscape Potential If score is: 1 = M 0 = L	0
S 6.0. Are the hydrologic functions provided by the site valuable to society?	
S 6.1. Distance to the nearest areas downstream that have flooding problems: The sub-basin immediately down-gradient of site has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds) Surface flooding problems are in a sub-basin farther down-gradient No flooding problems anywhere downstream	1 points = 2 points = 1 points = 0
S 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0	0
Total for S 6	1
Rating of Value If score is: 2-4 = H 1 = M 0 = L	1

NOTES and FIELD OBSERVATIONS:

Wetland name or number D

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat	
H 1.0. Does the site have the potential to provide habitat?	These questions apply to wetlands of all HGM classes. H 1.1. Structure of plant community: Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of 1/4 ac or more than 10% of the unit. If it is smaller than 2.5 ac. Add the number of structures checked. _____ Aquatic bed _____ Emergent _____ Scrub-shrub (areas where shrubs have > 30% cover) _____ Forested (areas where trees have > 30% cover) _____ If the unit has a Forested class, check if: _____ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon H 1.2. Hydroperiods Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or 1/4 ac to count (see text for descriptions of hydroperiods). _____ Permanently flooded or inundated _____ Seasonally flooded or inundated _____ Occasionally flooded or inundated _____ Saturated only _____ Permanently flowing stream or river in, or adjacent to, the wetland _____ Seasonally flowing stream in, or adjacent to, the wetland _____ Lake Fringe wetland _____ Freshwater tidal wetland
H 1.3. Richness of plant species	Count the number of plant species in the wetland that cover at least 10 ft². Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle If you counted: > 19 species points = 2 5 - 19 species points = 1 < 5 species points = 0 H 1.4. Interspersion of habitats Decide from the diagrams below whether interspersions among Cowardin plant classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. If you have four or more plant classes or three classes and open water, the rating is always high. None = 0 points Low = 1 point Moderate = 2 points High = 3 points

Wetland name or number D

H 1.5. Special habitat features:	
Check the habitat features that are present in the wetland. The number of checks is the number of points. _____ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long). _____ Standing snags (dbh > 4 in) within the wetland _____ Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) _____ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (cut shrubs or trees that have not yet weathered where wood is exposed) _____ At least 1/4 ac of thin-stemmed persistent structures or woody branches are present in areas that are permanently or seasonally inundated (structures for egg-laying by amphibians) _____ Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)	3
Total for H 1	Add the points in the boxes above
Rating of Site Potential If score is: 15-18 = H 7-14 = M 0-6 = L	
Record the rating on the first page	
H 2.0. Does the landscape have the potential to support the habitat functions of the site?	
H 2.1. Accessible habitat (include only habitat that directly abuts wetland units).	
Calculator: % undisturbed habitat $\frac{1}{2} + \frac{1}{2} \left(\frac{\% \text{ moderate and low intensity land uses}}{2} \right)$ = 7 % If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon points = 3 20-33% of 1 km Polygon points = 2 10-19% of 1 km Polygon points = 1 < 10% of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland.	
Calculator: % undisturbed habitat $\frac{1}{2} + \frac{1}{2} \left(\frac{\% \text{ moderate and low intensity land uses}}{2} \right)$ = 2 % Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10-50% and in 1-3 patches points = 2 Undisturbed habitat 10-50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	1
H 2.3. Land use intensity in 1 km Polygon: If	
> 50% of 1 km Polygon is high intensity land use points = 2 ≤ 50% of 1 km Polygon is high intensity points = 0	2
Total for H 2	Add the points in the boxes above
Rating of Landscape Potential If score is: 4-6 = H 1-3 = M 0-1 = L	
Record the rating on the first page	
H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.	
Site meets ANY of the following criteria: _____ It has 3 or more priority habitats within 100 m (see next page) _____ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) _____ It is mapped as a location for an individual WDFW priority species _____ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources _____ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan ✓ Site has 1 or 2 priority habitats (listed on next page) within 100 m	points = 2 points = 0 points = 1 points = 0
Site does not meet any of the criteria above	
Rating of Value If score is: 2 = H 1 = M 0 = L	
Record the rating on the first page	

H 2.0 used values from wetland B, wetland B more urbanized w/ one km

Wetland name or number D

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife, 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. <http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here: <http://wdfw.wa.gov/conservation/pbs/list/>)

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit. **NOTE:** This question is independent of the land use between the wetland unit and the priority habitat.

- **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ha (> 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- **Oregon White Oaks:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 159 – see web link above*).
- **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- **Talus:** Homogeneous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including hiprap slides and mine tailings. May be associated with cliffs.
- **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

Wetland name or number D

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
Check off any criteria that apply to the wetland. Circle the category when the appropriate criteria are met. SC 1.0. Estuarine wetlands Does the wetland meet the following criteria for Estuarine wetlands? — The dominant water regime is tidal, — Vegetated, and — With a salinity greater than 0.5 ppt Yes – Go to SC 1.1. (No) Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? Yes – Category I. No – Go to SC 1.2.	Cat. I
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? — The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i>, see page 25) — At least ½ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or unmowed grassland. — The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. Yes = Category I. No = Category II	Cat. I Cat. II
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? Yes – Go to SC 2.2. (No) Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? Yes – Category I. (No) Not a WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/hnp/whcv/whcvsearch/whcvsearch.asp Yes – Contact WHNP/WDNR and go to SC 2.4 No – Not a WHCV SC 2.4. Has WDNR identified the wetland within the S/TR as a Wetland of High Conservation Value and listed it on their website? Yes – Category I. No – Not a WHCV	Cat. I
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? Use the key below. If you answer YES you will still need to rate the wetland based on its functions. SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? Yes – Go to SC 3.3. (No) Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? Yes – Go to SC 3.3. (No) Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? Yes – Is a Category I bog No – Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? Yes – Is a Category I bog No – Is not a bog	Cat. I

Wetland name or number DWetland name or number D

SC 4.0. Forested Wetlands Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? <i>If you answer YES you will still need to rate the wetland based on its functions.</i> — Old-growth forests (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/acre (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more. — Mature forests (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm). Yes = Category I No = <u>Not a forested wetland for this section</u>	SC 5.0. Wetlands in Coastal Lagoons Does the wetland meet all of the following criteria of a wetland in a coastal lagoon? — The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks — The lagoon in which the wetland is located contains ponded water that is saline or brackish (>0.5 ppt) during most of the year in at least a portion of the lagoon (<i>needs to be measured near the bottom</i>) Yes - Go to SC 5.1 No = <u>Not a wetland in a coastal lagoon</u> SC 5.1. Does the wetland meet all of the following three conditions? — The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100). — At least ¼ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or unmowed grassland. — The wetland is larger than 1/16 ac (4350 ft²) Yes = Category I No = Category II	SC 6.0. Interdunal Wetlands Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUEO)? <i>If you answer yes you will still need to rate the wetland based on its habitat functions.</i> — Long Beach Peninsula: Lands west of SR 103 — Grayland-Westport: Lands west of SR 105 — Ocean Shores-Copalis: Lands west of SR 115 and SR 109 Yes - Go to SC 6.1 No = <u>not an interdunal wetland for rating</u> SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H₁H₂H or H₁H₂M for the three aspects of function)? Yes = Category I No - Go to SC 6.2 SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger? Yes = Category II No - Go to SC 6.3 SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac? Yes = Category III No = Category IV	Cat. I Cat. II Cat. III Cat. IV NA
Category of wetland based on Special Characteristics If you answered No for all types, enter "Not Applicable" on Summary Form.
