APPENDIX B – RESTORATION PLAN

Contents:

1. Introduction
2. Restoration Plan Requirements
3. Define Urban Restoration
4. Restoration priority Goals and Objectives
5. Shoreline Implementation Strategies and Restoration Opportunities
6. Specific Restoration Projects

THE GOALS OF THE RESTORATION PLAN ARE TO:

⇒ Improve water quality
⇒ Re-establish and restore natural shoreline processes, restore degraded and lost habitat, and wildlife corridors
⇒ Improve connectivity of the shoreline environments to one another and to adjacent habitat corridors and/or habitat blocks that support priority species and species of local significance.

1. Introduction

The Restoration Plan (RP) is designed to meet the requirements for restoration planning outlined in the Department of Ecology Guidelines; WAC 173-26-201 (2) (f) or, Guidelines. A Restoration Plan is not a regulatory document or a set of regulatory requirements. There are several regulatory sections in the SMP, however, that point to this RP as a guide for improving shoreline ecological function. Ultimately, a RP should include a vision for ecological restoration, including goals, objectives and opportunities. It also establishes city strategies for implementation, including recognition of existing and ongoing programs and provides a framework for long-term monitoring of shoreline restoration and shoreline conditions. While this restoration plan includes broad goals and objectives, the specific implementation measures, budgets, schedules, and individual monitoring programs will be needed for individual restoration projects as they occur.

The restoration priority goals, objectives, natural process / ecological function and potential metrics for restoration are shown on TABLE 1. The restoration opportunities and the associated objectives, activities and monitoring are shown on TABLE 2. Individual restoration projects are shown on TABLE 3.

TABLE 1 and TABLE 2 (and the 6 ‘Sections’ specified above) are the elements of the RP that is approved by DOE as part of the SMP. The specific projects identified in TABLE 3 are not a part of the approved SMP hence, may be revised and adaptively managed without the need to amend the SMP per the requirements in BMC Section 22.07.20.

A Restoration Plan is an integrated component of shoreline master programs that are intended to achieve overall improvements in shoreline ecological functions city wide over a certain time...
period when compared to the status of the shorelines upon adoption of an updated SMP. It must be noted that despite the intent of the RP to achieve overall improvements to shoreline ecological function over time it cannot be assumed that improvements to impaired systems is in and of itself adequate. The overarching goal of Restoration Plans is to return shorelines to functionally sustainable levels or, properly functioning conditions.

There is no required method or approach to development of Restoration Plans because jurisdictions vary by size, conditions of shorelines vary by watershed as do the ecological functions to be restored and availability of resources (grants, volunteers and equipment) can be questionable.

The restoration plan builds on the 2004 City of Bellingham Shoreline Inventory and the Characterization Report (Northwest Ecological Services, LLC) which provide a comprehensive inventory and analysis of shoreline conditions in Bellingham. The input of the Technical Advisory Committee (TAC) and the comments received from various agencies and special interest groups that reviewed this RP has also been added in terms of a baseline condition. The intent of this restoration plan is to provide the local governments, special interest groups, private property owners or non-profit agencies with the information and guidance necessary to implement a restoration project that will improve shoreline ecological function within a particular shoreline reach and is consistent with community restoration goals.

To ensure that restoration goals are being achieved, it is important for the city to evaluate the performance effectiveness of this plan and to adapt to changing conditions. At a minimum, this restoration plan (as well as the entire Shoreline Master Program) will be evaluated by the Department of Ecology for its ability to improve the overall ecological function of shorelines. The actual improvements to ecological function will be re-evaluated again in seven years when the 2007 SMP is updated again.

2. SMP Restoration Planning Regulatory Requirements

WAC 173-26-201(2)(f)(i-vi) identifies the following elements to be included in an adequate restoration plan.

(i) Identify degraded areas, impaired ecological functions, and sites with potential for restoration.

(ii) Establish overall goals and priorities for restoration of degraded areas and impaired ecological functions.

(iii) Identify existing and ongoing projects and programs that are currently being implemented, or are reasonably assured of being implemented (based on an evaluation of funding likely in the foreseeable future), which are designed to contribute to local restoration goals.

(iv) Identify additional projects and programs needed to achieve local restoration goals, and implementation strategies including identifying prospective funding sources for those projects and programs.

(v) Identify timelines and benchmarks for implementing restoration projects and programs and achieving local restoration goals.
(vi) Provide for mechanisms or strategies to ensure that restoration projects and programs will be implemented according to plans and to appropriately review the effectiveness of the projects and programs in meeting the overall restoration goals.

3. Define Urban Restoration:

The term “restoration” has a number of definitions, all of which share similar ideas. They often refer to the return of an area to a previous condition by improving the biological structure and function (Diefenderfer 2003). Examples of definitions of restoration put forth by various authors and agencies include bringing back a former, normal, or unimpaired state; a return to a previously existing natural condition; reestablishing vegetation; and returning a damaged ecosystem to its pre-disturbed state. The DOE shoreline master program guidelines state that:

“Restore,” “Restoration,” or “ecological restoration” means the reestablishment or upgrading of impaired ecological shoreline processes or functions. This may be accomplished through measures including but not limited to revegetation, removal of intrusive shoreline structures and removal or treatment of toxic materials. Restoration does not imply a requirement for returning the shoreline area to aboriginal or pre-European settlement conditions.

The Society of Wetland Scientists (2000) defines wetland restoration, which is similar to shoreline restoration, as actions taken in a converted or degraded natural wetland that result in the reestablishment of ecological processes, functions, and biotic/abiotic linkages that lead to a persistent, resilient system integrated within its landscape. In an effort to be clear and consistent in the discussion of restoration, five key elements of the concept of restoration are adapted from the Society:

1. Restoration is the reinstatement of driving ecological processes.
2. Restoration should be integrated with the surrounding landscape.
3. The goal of restoration is a persistent, resilient system.
4. Restoration should generally result in the historic type of environment but may not always result in the historic biological community and structure.
5. Restoration planning should include the development of structural and functional objectives and performance standards for measuring achievement of the objectives.

In this SMP, restoration is used broadly to also include conservation and enhancement actions. Conservation is different from restoration as described above in that it protects areas relatively free of degradation. Enhancement, which improves shoreline functions, but may not result in restoration of underlying process, may be more viable than restoration in some instances.

Restoration in Urban Settings (adapted from Borde et al., 2004)

More than 50% of the U.S. population lives on the coast, with a higher growth rate in coastal counties than in the country as a whole (NOAA 1998). The result of this development has been the loss of a high percentage of coastal habitats that were once present in urban areas.
Restoration in urban areas presents the following challenges:

- Multiple inputs water-shed wide that are outside of a restoration site.
- Limited sites available for restoration
- Limited reference sites
- Confounding factors, such as poor water quality, chemical contamination, and altered hydrology
- Fragmented habitat
- High costs due to land acquisition expenses and the amount of work required to reverse habitat modifications
- Differing needs for coastal resources (e.g., economic, cultural, social, recreational, environmental) (Brammeier 2003)
- Differing values of local citizens (Ehrenfeld 2000).

However, these challenges are often offset by the following benefits:

- The restored habitat provides pockets of habitat where otherwise there would be none
- Restored habitat can provide a connectivity to adjacent, more functional habitats (TAC)
- Additional natural landscapes for urban residents (Ehrenfeld 2000)
- A heightened public awareness of coastal ecosystems (Milano 1999)
- Educational opportunities
- Public involvement in the restoration process of highly visible projects, resulting in community project stewardship

Urban restoration represents the perhaps the most critical and challenging situation to use the principles of landscape ecology for choosing a restoration site. While the challenges of urban restoration are many, the importance of habitat restoration in these settings is monumental from an ecological and societal perspective. The ecological importance of projects in urban areas can be disproportional to the size of the project because of the lack of ecological habitat in the surrounding areas (Borde et al., 2004).

**4. Restoration Priority Goals and Objectives**

The priority goals and objectives below were developed for the City of Bellingham 4-26-07 DRAFT SMP in order to implement the following Bellingham Comprehensive Plan goals and visions:

**Implementation of TMDL Response Plan for Lake Whatcom**: This Plan is currently being developed by the City of Bellingham and Whatcom County and is anticipated to have a draft completed for City / County Council review mid 2010.

**Vision for Bellingham #57**: Citizens and property owners join forces to protect the quality of Lake Whatcom, its watershed, the City's other lades and creeks and Bellingham Bay. Through community education, regulations, performance based development standards and public private cooperation, the community as a whole supports protection of these natural resources as a priority. (Comprehensive Plan, Chapter 1, Framework Goals and Policies)
Parks, Recreation and Open Space Plan; Chapter 8:

8.1 Resource conservancies
Incorporate unique ecological features and resources into the park system to protect threatened species, preserve habitat, and retain migration corridors that are unique and important to local wildlife.

Wildlife habitat
a: Identify and conserve critical wildlife habitat including nesting sites, foraging areas, and migration corridors within or adjacent to natural areas, open spaces, and the developed urban area.
b: Preserve especially sensitive habitat sites that support threatened species and urban wildlife habitat - such as the shoreline areas along the Little Squalicum, Squalicum, Whatcom, and Padden Creeks.

Natural areas
a: Preserve and protect significant environmental features including unique wetlands, open spaces, woodlands, shorelines, waterfronts and other characteristics that support wildlife and reflect Bellingham’s resource heritage – such as Lake Padden and Lake Whatcom.
b: Provide public access to environmentally sensitive areas and sites that are especially unique to the Bellingham area - such as Chuckanut Bay.

8.2 Open spaces and preserves
Develop a high quality, diversified park system that preserves and enhances significant environmental resources and features.

Open spaces
a: Define and conserve a system of open space corridors or separators to provide definition between natural areas and urban land uses within the Bellingham developing area – such as Connelly Creek Nature Area.
b: Increase natural area and open space linkages within the developed area, particularly along the BNSF Railroad and I-5 Interstate corridors.
c: Preserve environmentally sensitive areas as natural area linkages and urban separators, particularly the Whatcom, Padden, and Squalicum Creeks corridors.

Vision: As described herein, wildlife habitat and resource conservancies may be realized through:

- Acquisition of title and/or development rights of habitat lands - that would otherwise be developed for other land uses;
Restoration Plan

- Provision for public access and interpretive use - which would not be possible if the lands remained in private ownership; and
- Conservation for wildlife migration corridors - through developing urban areas and neighborhoods.

The RP priority goals and objectives are also intended to be consistent with the ‘Preservation / Enhancement Opportunities’ specified within each reach in the 2004 City of Bellingham Shoreline Characterization. (APPENDIX C)

Ultimately, the City’s foundational goal is to be able to show that there has been a net overall gain in shoreline ecological function – whether through restoration planning and implementation or via SMP policies and development regulations.

Characterizing the variety of goals and visions stated above into three basic priority goals for restoration city-wide, they would be:

1. Improve water quality
2. Re-establish and restore natural shoreline processes, restore degraded and lost habitat, and wildlife corridors,
3. Improve connectivity of the shoreline environments to one another and to adjacent habitat corridors and/or habitat blocks that support priority species and species of local significance.

Objectives identify specific measurable actions that can be taken to achieve the stated goals. For example, to meet the goal of improving water quality, an objective might be to remove creosote pilings. The following objectives have been developed to achieve the restoration priority goals:

1. Restore and protect habitat forming processes.
2. Restore and protect wildlife corridors.
3. Restore and protect native vegetation and native species.
4. Restore and protect wetlands and salt marsh habitat.
5. Remove intertidal fill, creosote contaminated logs, pilings and debris.
6. Remove or improve fish passage barriers.
7. Increase Large Woody debris availability and recruitment opportunities.
8. Manage and treat stormwater to improve water quality, decrease peak flow events, and increase implementation of LID practices.
9. Perform voluntary and/or State mandated remediation of contaminated sediments in aquatic and upland environments.
10. Purchase development rights on undeveloped tracts / blocks that are abutting critical areas in order to manage water quality and the land as fish and wildlife habitat conservation areas.
11. Purchase conservation easements that stipulate no development and allow public access for recreation, if compatible with the land.
12. Purchase right-of-first-refusal on property that includes important habitat; if acquired, consider a minimal development scheme to help cover the cost of acquisition while maintaining the ecological integrity of the property.
Restoration Plan

These objectives assist with defining actions or projects to restore the natural processes and ecological functions identified in the Characterization Report as ‘not properly functioning.’ Opportunities and strategies are then identified as means of implementing the objectives. At this level, no measurable performance standards are applied to goals. For example, the overall goal is to improve water quality to meet the vision of a restored ecosystem, not to improve it by "X" amount. Individual restoration projects that may be implemented as part of this plan are expected to include specific measurable goals.

In accordance with the DOE shoreline guidelines, it is also valuable to establish general priorities. Restoring environmental processes (such as hydrology) provides the foundation for habitat structures (i.e., Large Woody Debris and back or side channels, braided channels), and that structure in turn, supports habitat functions. (i.e., production, food support, rearing, etc.) (Thom. 2003) That is, restoration of habitat functions may be ineffective if habitat structures and controlling factors are not also restored. While Thom states, “There is no universally accepted method for setting priorities for nearshore sites for restoration or for determining what strategies are best applied to each site. We have found that restoration of controlling factors is the key to successful and long-term restoration.” General priorities for shoreline management could follow mitigation sequencing, specified in the 4-26-07 DRAFT SMP; Section 22.08.100. That is, conservation and preservation should be the highest priority, followed by avoidance, followed by restoration, then enhancement and monitoring.

Overall priority should be given to protection and restoration of natural processes that are needed to support habitat structure and habitat functions.

Thorough scientific evaluation and prioritization of all restoration opportunities was not feasible for this SMP. However, Bellingham can work with local and regional agencies and scientists to help identify restoration of the greatest importance according to scientific criteria.

Ultimately, priorities will be opportunistic based on site access, available funding, and feasibility. Of the restoration opportunities listed, stormwater system improvements to address untreated stormwater outfalls may be the most readily feasible for the City due to public control of the system, a dedicated funding sources and the need to also address clean water planning requirements to meet EPA standards.

Table 1, below, shows the relationship of the goals, objectives, restored natural processes, ecological functions and how those improvements might be measured. Table 1 is not meant to be an exhaustive list and does not prohibit other meaningful objectives from being pursued. The first column shows the goals, the second column shows the objectives associated with those goals and the third column shows the natural process and ecological function that will be enhanced by completing the objectives. Objectives are found under multiple goals affecting different natural processes and ecological functions. Potential metrics for measuring and monitoring each objective are listed in the far right hand column. Opportunities for implementation are listed in Table 2 in the next section.

Restoration Plan

5. Restoration Implementation Strategies and Opportunities

Restoration implementation strategies are adopted or identified programs and/or plans that help achieve the Restoration Plan priority goals from Section 4 which were:

1. Improve water quality
2. Re-establish and restore natural shoreline processes, restore degraded and lost habitat, and wildlife corridors,
3. Improve connectivity of the shoreline environments to one another and to adjacent habitat corridors and/or habitat blocks that support priority species and species of local significance.

These implementation strategies should include at least one of the objectives from Section 4, which were:

1. Restore and protect habitat forming processes.
2. Restore and protect wildlife corridors.
3. Restore and protect native vegetation and native species.
4. Restore and protect wetlands and salt marsh habitat.
5. Remove intertidal fill, creosote contaminated logs, pilings and debris.
6. Remove or improve fish passage barriers.
7. Increase Large Woody debris availability and recruitment opportunities.
8. Manage and treat stormwater to improve water quality, decrease peak flow events, and increase implementation of LID practices.
9. Perform voluntary and/or State mandated remediation of contaminated sediments in aquatic and upland environments.
10. Purchase development rights on undeveloped tracts / blocks that are abutting critical areas in order to manage water quality and the land as fish and wildlife habitat conservation areas.
11. Purchase conservation easements that stipulate no development and allow limited public access for recreation, if compatible with the land.
12. Purchase right-of-first-refusal on property that includes important habitat; if acquired, consider a minimal development scheme to help cover the cost of acquisition while maintaining the ecological integrity of the property.

The City has restoration implementation strategies that are currently in place and existing plans and programs that are being updated. These strategies are not usually regulatory provisions found within Bellingham’s Municipal Code (BMC). Typically, they are developed in a comprehensive planning effort and result in a set of recommended strategies developed by a technical team comprised of those that have expertise or experience with the relevant topic.

What follows is an up-to-date summary, although not exhaustive, of restoration implementation strategies that the City is currently involved in order to achieve the Priority Goals.
“TMDL Response Plan” by City of Bellingham and Whatcom County.
This Plan is currently being developed by the City of Bellingham and Whatcom County and is anticipated to have a draft completed for City / County Council review mid 2010.

“City of Bellingham Wildlife Habitat Assessment” by Nahkeetah Northwest Wildlife Services, December 2003, and as amended.
In cases where the City (and in cooperation with the County, Water District #10 and other applicable agencies including non-profit organizations) intend to take action relevant to Priority Goal #3 and Objectives 10-12, from above, the ‘City of Bellingham Wildlife Habitat Assessment’ should be consulted and it’s management recommendations implemented whenever feasible and practical.

This document provides uses with a comprehensive list of watershed scale factors and criteria to consider which are crucial to make informed decisions when planning and designing stream restoration and rehabilitation projects. Factors and criteria include:

- Site, reach and watershed assessments
- Problem identification
- Identifying and selecting an approach
- General approaches to solving common restoration objectives
- Stream and riparian restoration techniques

Watershed processes and conditions that shape stream channels, stream ecology, geomorphology, hydrology, hydraulics, planting considerations and erosion control and construction considerations are also presented in this document.

City staff should consult this manual as part of their planning and design for restoration projects. Private restoration projects should be informed of this document and utilize it when conducting required or voluntary habitat restoration.

Private property owners should also explore opportunities for enrollment in the Open Space Taxation Program as specified in RCW 84.34 and WAC 448-30 in order to satisfy Objectives 10-12. The basics of this program can be found on Whatcom County’s webpage under the “Assessor” sub-category.

Lake Whatcom Management Program. WEBSITE: lakewhatcom.wsu.edu
This program has been developed by the legislative bodies, a management team, the Inter-jurisdictional Coordinating Team, agency staff, and advisory committees from The City of Bellingham, Whatcom County and Water District 10. The initial piece of legislation that jumpstarted these efforts was the Joint Resolution that was adopted by the City of Bellingham, Whatcom County, and Water District 10 in 1992; Joint Resolution Whatcom County 92-73, Bellingham No. 92-69, District No. 560.

The goals within this Resolution are as follows:
Restoration Plan

- To recognize Lake Whatcom and its watershed as the major drinking-water reservoir for the County and develop public and private management principles for the lake and watershed consistent with a drinking water reservoir environment. Affirm this goal by establishing the name: Lake Whatcom Reservoir.
- To protect, preserve and enhance water quality and manage water quantity to ensure long-term sustainable supplies for a variety of uses, with priority placed on domestic water supply. Management programs and actions will be made in recognition of existing contractual agreements and potential for review and renegotiation in light of these goals.
- To prioritize protection over treatment in managing Lake Whatcom and its watersheds. Management actions shall reflect a long-term view of replacement or treatment costs.
- To manage water quantity to sustain long-term efficient use of the water for beneficial uses within the county that are consistent with a drinking-water reservoir, and recognize the integral link with the Nooksack River and associated water resource concerns.
- To ensure that opportunities for public comment and participation are provided in policy and management program development, and to promote public awareness and responsible individual actions.
- To promote learning, research, and information opportunities which better our understanding of the watershed system, the impacts of activities, and the benefits and potentials of policies implemented.

(This program is an implementing strategy of Priority Goal #1, Objective #8)

Lake Whatcom Watershed Property Acquisition Program; Public Works Department.
This program is funded through water usage fees and its main objective is to protect our drinking water source by purchasing tracts of undeveloped land within the Lake Whatcom Watershed. This essentially removes a certain density or, number of units from the development folio within the watershed. The City places a higher importance on parcels that are contiguous to already protected lands or contain sensitive environmental features such as tributaries to the Lake. This program also helps to protect parcels by utilizing conservation easements or restrictive covenants.

Whatcom County, Water District #10 and Sudden Valley Community Association are also instrumental in this program to protect our drinking water source.

At the time of this publication the program has protected approximately 1,340 acres and eliminated about 660 developable units from impacting the watershed. This program is expected to continue long into the future in order to protect the Lake Whatcom Reservoir.

(The total amount of acres preserved in the Lake Whatcom watershed as of this printing by a variety of agencies including the Whatcom Land Trust, the City and County Park...
Restoration Plan

Departments and the Department of Natural Resource is 2,519. (This program is an implementing strategy of Priority Goals #1-3, Objectives #10-12)

Urban Streams Monitoring by City of Bellingham Public Works Department and TMDL study’s in coordination with Department of Ecology.

This program, initiated in 1990, was developed and designed to provide water quality data for all the City’s urban streams in order to measure compliance with the State’s surface water quality standards specified in WAC 173-201. For example, within the streams, the City monitors the following parameters: temperature, fecal coliform, dissolved oxygen, pH, turbidity and conductivity. This program is not regulatory and does not provide management recommendations.

When a stream (or any water of the state) exceeds water quality thresholds, the Department of Ecology in coordination with the applicable jurisdiction, initiates a water cleanup plan or ‘TMDL.’ (Total Maximum Daily Load) These water clean up plans describe the type, amount and sources of water pollution in a particular water body, they analyze how much the pollution needs to be reduced or eliminated to meet water quality standards and they provide targets and strategies to control the pollution. (This program is an implementing strategy of Priority Goal #1, Objective #8)

Update of the City’s 1995 Watershed Master Plan (Ongoing)

The update of this plan is being conducted by the City’s Public Works Department and is anticipated to be complete in July; 2007. This plan will include hydrologic simulation of different flow patterns and intensities within the City’s streams and floodplains and ultimately, create a basis for basin or, watershed planning. This planning will assist the City anticipate impacts from flooding and high flows, delineate areas within basins for future build-out and identify restoration opportunities and capital improvement projects that will restore shoreline ecological functions and processes. This plan will not be a regulatory document but will provide management recommendations in order to achieve its objectives. (This plan is an implementing strategy of Priority Goal # 2, Objective #’s 1-4, 6-8 and 10)

Nooksack Salmon Enhancement Association Strategic Plan. WEBSITE: n-sea.org

Nooksack Salmon Enhancement Association (NSEA) is a community–based nonprofit organization dedicated to restoring sustainable wild salmon runs in Whatcom County. Their Strategic Plan from October, 2005 has ten goals aimed at achieving their mission. Paraphrased, these are:

1. Enhance, rehabilitate and restore critical salmonid habitat.
2. Evaluate NSEA’s salmonid restoration activities through implementation, effectiveness and validation monitoring.
3. Develop partnerships with landowners to identify and implement salmonid recovery projects.
Restoration Plan

4. Implement watershed based stewardship programs that integrate education with restoration outreach.
5. Develop and implement education programs for elementary through post-secondary level students.
6. Develop community awareness of NSEA.
7. Maintain NSEA’s focus and identity as a community based nonprofit.
8. Integrate and empower volunteers to assist NSEA in all parts of its mission.
9. Strengthen internal structure to support effective and efficient operations.
10. Maintain a diverse, stable and predictable funding base and strong financial resources and reserves.

NSEA has recently expanded their focus to partner with the Washington State Department of Fish and Wildlife in order to develop the ‘Lake Whatcom Native Salmon and Trout Conservation and Recovery Plan.’ This plan targets the recovery of native salmonids in Lake Whatcom including kokanee and cutthroat trout. With the cooperation from the City of Bellingham, Whatcom County and Water District #10, this plan will support the restoration and conservation efforts necessary to recover these fish populations. (This plan is an implementing strategy of Priority Goal #2 and #3, Objective #’s 1-4, 6-8, 10)

The Bellingham Bay Comprehensive Strategy (CS) was developed by the Bellingham Bay Demonstration Pilot Project team as a supplement to the original EIS (October 2000) for the Whatcom Waterway Cleanup Site. This CS was a bay-wide approach to planning and included 8 sub-areas; each with its own recommended strategy, a description of anticipated land uses, habitat restoration opportunities and potential sediment sites, cleanup, disposal and source control issues.

The anticipated land uses and habitat restoration opportunities in the CS was the basis for more detailed work developed by the Habitat Subcommittee, (a sub-group of the Pilot Team) the Waterfront Futures Group, and an interagency workshop that created the “Opportunities and Ideas for Habitat Restoration and Water Access on Urban Bellingham Bay” in January, 2004 as part of the Waterfront Futures Group’s planning efforts.

The overall goal of the Habitat Restoration Documentation Report (February, 1999) is to ‘Maximize Bellingham Bay habitat productivity to the extent possible.’ The objectives developed to achieve this goal are listed below – some of which are condensed and captured in TABLE 2:

⇒ Containing or removing shoreline landfills.
⇒ Maximizing shoreline riparian vegetation.
⇒ To the extent possible achieving a net gain in in-water habitat, saltmarsh, and marine buffer.
Restoration Plan

1. Providing habitat connectivity.
2. Restoring the viable estuaries known to support a variety of species.
3. Removing remnant in-water structures.
4. Removing historic shoreline fills.
5. Removing or replacing creosote treated timber piles.
6. Identifying opportunities for restoration that would not necessarily be associated with compensatory mitigation.
7. Restore historical eelgrass beds. (Zostera Marina)
8. Modify substrates.
9. Create shallow water habitat by modifying elevations.
10. Establishing habitat reserve areas in areas where certain habitats are difficult to replace and/or that support multiple species and/or multiple life history stages for a variety of species.

The Bellingham Bay Action Team remains active in identifying ways in which the habitat restoration opportunities specified in the plans specified above and those within TABLE 3 can be implemented. (This plan is an implementing strategy of Priority Goal #1-3, Objective #'s 1-9)

Master Restoration Plan (MRP): City’s Environmental Resources Division of Public Works. (Ongoing)

In 2007, the City’s Environmental Resources Division of the Public Works Department will be retaining a consultant to begin developing a restoration master plan which will identify priority restoration projects based on the foundation laid by this Restoration Plan. This work can be added to TABLE 3 without having to amend the RP via the SMP Amendment process outlines in BMC Section 22.07.20.

Residential Stormwater Retrofit Project (RSRP): City’s Environmental Resources Division of Public Works.

This project makes it easy for single family home owners within the Lake Whatcom watershed to voluntarily retrofit or install SFR stormwater treatment systems.

Whatcom County’s Shoreline Master Program Update – Background Information, Volume III; Restoration Plan

The County’s Restoration Plan has three watersheds that overlap into City Jurisdiction. These are the Squalicum Creek, Lake Whatcom and Bellingham Bay watersheds.

The portion of the Squalicum Creek watershed that is within the County is not considered a shoreline of the state (does not have adequate flow) but nonetheless is a critical area. These upper reaches have restoration potential that can affect the shoreline ecological function of the portion of Squalicum Creek that is within the City limits and Shoreline jurisdiction. (Please see Section 4.2.1 of the County’s Restoration Plan.)
Restoration Plan

Lake Whatcom is jointly managed by Whatcom County, the City and Water District #10. The County is responsible for the nearly all of the Lake’s tributaries through their CAO, SMP and other applicable development regulations. The County also references the Lake Whatcom Management Program in their Restoration Plan as the main body of work utilized as a guide for improving the ecological function of that water-body over time. (Please see Section 4.2.2 of the County’s Restoration Plan.)

The City and the County restore through a variety of existing programs whenever feasible within the many watersheds that contribute to Bellingham Bay. Specifically, the County’s Restoration Plan identifies those shorelines within Bellingham Bay proper that are not within the city limits. These are shorelines south of Chuckanut Bay and the shoreline north of Mount Baker Plywood also known as Fort Bellingham and around to the southern end of Lummi Shore. (Please see Section 4.2.3 of the County’s Restoration Plan.)

Implementation strategies are mostly dependent upon available funding and individuals and/or groups to perform the work. The three groups with the strongest funding sources and most commonly performing restoration work city-wide are; the Washington Conservation Crew, Greenways and the Nooksack Salmon Enhancement Association. The City of Bellingham and Whatcom County are also involved in seeking funding and resources and in some cases overlap with one another and the non-profit groups specified above. (There are many other smaller groups and organizations that perform important restoration work city-wide) Given this, there are other determining factors for implementation of restoration projects. These implementation strategies listed above do not account for the many other Federal, State and local agencies that have either developed or are creating new comprehensive restoration plans and programs for local accessibility and utilization. These agencies include but are not limited to;

Puget Sound Action Team
Puget Sound Nearshore Restoration Partnership
Department of Ecology
Department of Natural Resources
Department of Fish and Wildlife
Marine Resources Committee
Nooksack Salmon Enhancement Association
Lummi and Nooksack Tribes
Nooksack Recovery Team
Northwest Indian College
Public Utility District #1

Restoration opportunities are abundant in every habitat type, whether within freshwater, within the marine nearshore or within an estuarine environment. Examples at various scales include; marine and tidal freshwater marshes; freshwater river and stream corridors; unvegetated tidal flats; pocket estuaries; pocket beaches; forested and unforested wetlands; eelgrass meadows; kelp beds; shellfish beds; and rocky and gravel shorelines. (Diedenderer 2003)
Innumerable local projects exist. Several large-scale restoration projects, each of which encompasses multiple habitats, have also been initiated in Bellingham in recent years. For example: Whatcom Creek estuary/Holly Street Landfill, Post Point Lagoon, GP Log Pond and various reaches of our urban stream corridors.

It is becoming increasingly clear that the estuaries and nearshore areas of the Pacific Northwest provide critical feeding and rearing habitat for salmon populations. (Simenstad and Cordell 2000; Williams et al. 2001) Salmon restoration efforts, once highly focused in the watersheds where salmon spawn, are now emphasizing the estuary and nearshore. (Diedenderer 2003).

Sustainable development necessitates that restoration projects be considered in a landscape context. External influences may affect the performance of restored coastal ecosystems, even as changes brought about by restoration affect surrounding areas.

Site-specific evaluation of the landscape in the planning phase of a restoration project is critical. Attributes such as size, shape, configuration, and connectedness dramatically affect the net functional habitat provided by a restoration project.

For sustainable development to succeed, the goal today must not be simple maintenance of the status quo, but a net improvement of the ecosystem. Urban ecosystems are shrinking or experiencing diminished functionality (Field 1998; Fonseca et al. 1998; Thayer 1992; Turgeon et al. 2002). The NRC (2001) has shown that the no net loss policy for wetlands is not working. Simply put, we have failed to constrain development to minimize damage; we do not compensate for damages immediately so as to offset any losses; and we do not have a high degree of predictability in the outcome of restoration efforts. This means that the size, quality, location, and viability of a restoration project meant to compensate for development must overwhelmingly and obviously compensate for the expected losses. This approach provides a cushion to account for uncertainties in the ability of combined conservation and restoration efforts to meet their goals. As the level of experience, body of knowledge, and record of success increases, the level of uncertainty decreases along with the magnitude of effort required to compensate for uncertainty (Diedenderer 2003).

Below are examples from Fidalgo Bay, Washington for ecological evaluation criteria for use in selecting restoration sites (Borde et al., 2004).

- Feasibility
- Opportunity to improve ecosystem function
- Site protection
- Potential for sediment deposition/transport processes to support sustained function
- Potential to benefit threatened and endangered species
- Probability of success
- Habitat connectivity
Table 2 identifies opportunities for each shoreline segment that have been identified in the 2004 City of Bellingham Shoreline Characterization and through other shoreline planning processes. These are opportunities for restoration that correspond to the RP goals and objectives.

This is an extensive list that likely exceeds near term funding opportunities, and yet, is not exhaustive. Additional restoration opportunities may continue to be identified through local and regional shoreline monitoring and planning actions. The City may periodically identify additional restoration opportunities that are consistent with the objectives of this restoration chapter.

Restoration projects are most viable when they occur on publicly owned properties or properties that are dedicated to the City specifically for restoration purposes. Restoration projects on publicly owned properties allow for more extensive and complete projects to be designed and implemented.

Restoration projects on private property where access for said restoration has been granted via an access or conservation easement is becoming more common as those properties become more economically feasible to develop. Conservation easements are typically granted by private landowners across required buffer areas as a result of a development project. Access easements for restoration projects are typically granted by cooperative private landowners at the request of the City.

<tr>
<td>7. Port-Hilton Harbor. BBDP #10. Marine reach # 5.</td>
<td>Shallow water habitat could be established by raising the elevation next to the Aerated Stabilization Basin (part of the Whatcom Waterway site). Marine buffer fringe habitat could be established at high elevations and/or site elevations could me modified to meet the elevations of the existing eelgrass bed. Allow for natural eelgrass colonization or do limited eelgrass transplanting.</td>
<td>Work will begin when funding is available</td>
</tr>
<tr>
<td>8. Georgia-Pacific Log Pond - East. BBDP #11. Marine reach 5.</td>
<td>Shallow water habitat could be established by raising the elevation next to the ASB. Marine buffer fringe habitat could be established at high elevations and the site could support either marsh plants or eelgrass at lower elevations.</td>
<td>Work will begin when funding is available</td>
</tr>
<tr>
<td>9. Georgia-Pacific ASB - South. BBDP #12. Marine reach # 5.</td>
<td>Elevations could be raised or modified to expand the existing eelgrass bed on the west side of the ASB. About 200, 000 cubic yards would be required to create habitat at elevations suitable for eelgrass.</td>
<td>Work will begin when funding is available</td>
</tr>
<tr>
<td>10. Sash and Door (Holly Street Landfill) BBDP #14. Whatcom Creek reach #1.</td>
<td>This action involved removing fill from the Sash and Door site and establishing estuarine riparian buffer, marsh, and mudflat banks.</td>
<td>Completed</td>
</tr>
<tr>
<td>11. Head of Whatcom Waterway. BBDP #17. Marine reach #5 &amp; 6.</td>
<td>The concept would be to modify elevations and substrates in the head of the waterway to establish estuarine riparian buffer, mudflat benches, and marsh. Perhaps introduce rootwads or other structure to the head of the waterway.</td>
<td>Work will begin when funding is available</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>12. Georgia-Pacific Log Pond. BBDP #18. Marine reach #6.</td>
<td>In 2001, Georgia-Pacific completed construction of a combined sediment cleanup/habitat restoration action in their former log pond. The project converted subtidal mudflat/debris and low intertidal riprap into 2.7 acres of shallow subtidal and 2.9 acres of low clean silt and sand habitat.</td>
<td>Completed. In addition, funding has become available to seed pond area with eelgrass starts for additional habitat feeding and migration areas.</td>
</tr>
<tr>
<td>13. Cornwall Avenue Landfill. BBDP# 20. Marine reach #7.</td>
<td>Remove garbage from the in-water portion of the landfill. Cut back bank along shoreline and remove garbage. Re-grade upland to intercept an appropriate shallow water elevation. Establish intertidal habitat, marine buffer fringe, possibly a saltmarsh, and potentially expand the sparse eelgrass patches (0.25 acre) just offshore of the seaward extent of the garbage.</td>
<td>Work will begin when funding is available</td>
</tr>
</tbody>
</table>
### Restoration Plan

| **14. Boulevard Park. BBDP #21. Marine reach #9.** | Two actions could occur along the shoreline and offshore from about 600 to 800 ft north of Boulevard Park to the south end of the Park. The first action is shoreline substrate modification. Substrates consist of riprap and large rock and concrete debris. These substrates could possibly be removed and replaced with coarser grain sand and gravel to provide surf smelt and sand lance spawning areas. Alternatively, finer grained substrates could be placed in the interstices to provide some epibenthic habitat. The second action would occur offshore and consist of potentially restoring eelgrass or providing substrates to support kelp. | Work will begin when funding is available |
| **15. Padden Creek - North Shoreline. BBDP #23. Marine reach #11.** | Remove shoreline fill and create mudflat and/or saltmarsh | Work will begin when funding is available |
| **16. Padden Creek - North - In-water. BBDP #24. Marine reach #11.** | Remove treated wooden pier to remove creosote from the environment. This may provide an opportunity for existing eelgrass beds to expand. Remove a small filled area that protrudes waterward of the OHW line at the landward end of the pier structure. | Work will begin when funding is available |

Whatcom Creek

| 46. | Horton Towing Segment. Whatcom Creek reach #4. | Increase riparian area by rolling back fence - graveded parking area - removal of noxious and install new native mix of conifers, under story and shrubs. | potential for WCC or via private devel. Work will begin as funding is available or project proposal warrants. |
## Restoration Plan

| 47. Red Tail Reach/Bay City Supply. Whatcom Creek reach #4. | The City is in the process of acquiring .73 acres on land on the north side of Whatcom Creek directly across the creek from a large City-owned property on the south side of the creek. Project includes meander bends, side channels, woody debris installations throughout the reach, and replacement of invasive plant species with native vegetation. This reach provides the best spawning habitat in Whatcom Creek for Chinook, Coho, pinks and steelhead despite the degraded channel conditions (straightened with no complexity) and lack of significant native vegetation or canopy cover. The woody debris structures will be placed to redirect flow, improve habitat conditions, provide bank protection and regulate channel migration activity, improving the degraded riparian function of the area. | City of Bellingham: Environmental Resources | Project funded by FY 2005 Centennial Clean Water Grant. Project will be completed by City of Bellingham, Environmental resources Division and fully completed by December of 2010. |
### Detailed Implementation Plan (DIP), Bacteria and Temperature TMDL.

**Whatcom Creek drainage analysis: ECO FUNCT: water quality.**

Creek exceeds TMDL standards for temperature and bacteria. The DIP will take major steps at removing Whatcom Creek from the 303(d) list. Using a combination of source monitoring and land use analysis fecal conform sources will be identified. Information generated from these activities will guide the development of source controls and BMPs used to reduce or eliminate fecal coliform loading in the Whatcom Creek watershed. Temperature problems will be handled by the Dept. of Ecology.

**Status:** Project funded by FY 2005 Centennial Clean Water Grant. Project will be completed by City of Bellingham, Environmental Resources Division and fully completed by December of 2010.

### Salmon Park. Whatcom Creek reach #4 and 5.

Extensive habitat enhancement project that increases wetland areas hydro connected to Cemetery Creek, installs LWD for back channeling and refuge. (Salmon and habitat improvement project)

City of Bellingham

Scheduled to being in 2005.

### Cemetery Creek. Whatcom Creek reach #5.

Extensive habitat enhancement project that increases wetland areas hydro connected to Cemetery Creek, installs LWD for back channeling and refuge. (Salmon and habitat improvement project)

City of Bellingham

Scheduled to begin in 2006.

### Mouth to Cornwall. Reaches #1 and 2.

Invasive species removal and new native vegetation installation.

City of Bellingham, WCC

ongoing since 2001.

### State Street to Meador. Reach #3.

Invasive species removal and new native vegetation installation.

City of Bellingham, WCC

2003 - present

### Lake Whatcom

The following, ongoing projects and plans help to protect the lake as a drinking water and recreation source for City residents as well as preserve the natural environment of watershed:

In 2005, the City and County Councils and the Lake Whatcom Water & Sewer Dist. Commissioners (known as the Joint Councils and Commissioners) approved the "2005-2009 Lake Whatcom Work Plan". This represents the second five-year work plan developed for the management of Lake Whatcom as a drinking water reservoir. Both plans were developed from a list of goals and policies adopted by the Joint Councils and Commissioners in a 1992 Joint Resolution. In addition, the plans are based on priorities established by the Joint Councils and Commissioners in 2004.

The work plans are written by the Lake Whatcom Interjurisdictional Committee Team (ICT) which is comprised of staff from the three jurisdictions. The ICT writes the plans, implements the plan tasks, and reports on task progress to the Joint Councils and Commissioners biannually. The ICT also responds to the respective jurisdictions as new issues and priorities arise.

The "WRIA 1 Watershed Management Program brings together citizens, local governments, tribes, and state and federal agencies to develop plans for allocating water, protecting water quality, and restoring fish habitat." Water Resource Inventory Area No. 1 (WRIA 1) includes Lake Whatcom, encompassing "the surface and ground water in the Nooksack River basin and certain adjacent watersheds."

Continuous temperature monitoring (Total Maximum Daily Load Monitoring (TMDL)), under the Clean Water Act determines the source of pollution in the watershed and tries to reduce pollutants. The study will be completed in January 2005. Once the study is competed, there will be a deliberation with the city to determine the best strategies to reduce the pollution allocation.
Restoration Plan

Stormwater Pollution affects the water quality of the lake. A Seasonal Land Disturbance Restriction is in effect as well as a Priority Inspection area that monitors areas three to four times a month.

Beginning in 1981, a monitoring program was initiated by the city and the Institute for Watershed Studies at Western Washington University that was designed to perform long-term water quality data for the lake. Annual reports have been issued since 1990. In addition to long-term water quality data, the program also evaluates annually, the effectiveness of storm water treatment in the lake's watershed, and to monitor the hydrology of the lake.

The Silver Beach Ordinance was passed in 2001, reducing development impacts by prohibiting certain non-compatible land uses, limiting impervious area, placing seasonal limits on earthwork, minimizing the use of harmful materials and other best management practices.

The city performs Recreational Beach Monitoring at Bloedel-Donovan Park to check bacteria levels and DNA source tracking. Results from 2002 show that some prominent sources of E-coli bacteria in the lake come from geese.

Owning land is one of the best ways at controlling land use and development. The City of Bellingham’s Lake Whatcom Watershed Property Acquisition Program, financed by water-usage fees, aims at preserving and improving our drinking water quality by purchasing land within the Lake Whatcom Watershed. The City actively seeks properties within the watershed, particularly ones that adjoin lands already owned by the City. Or property owners and realtors familiar with the program bring information to the City regarding potential properties.

As part of a larger package of tools and techniques to help protect the Lake Whatcom Watershed, the Whatcom County Council adopted in December of 1999 amendments to the county zoning ordinance and maps to enable a Transferable Development Rights (TDR) program. This program allows a landowner to transfer their residential development rights to another owner or to another piece of property, outside of the Lake Whatcom Watershed. The effectiveness of the current program guidelines is being reviewed and will be modified.

Identified restoration projects within the “OPPORTUNITIES AND IDEAS FOR HABITAT RESTORATION AND WATER ACCESS ON URBAN BELLINGHAM BAY” (including APPENDIX A and B) from the Interagency Workshop held on January 22, 2004, prepared for the Waterfront Futures Project, by Anchor Environmental, LLC, February 20, 2004.
