

# Transportation Report on Annual Mobility

Published annually in support of Bellingham's:

- Comprehensive Plan Multimodal Transportation Chapter;
- Multimodal Transportation Concurrency Program;
- Pedestrian Master Plan;
- Bicycle Master Plan;
- Transportation Benefit District No. 1;
- Whatcom Transportation Authority Strategic Plan;
- Multimodal Transportation Impact Fee Program;
- Urban Village TIF Reduction Program; and
- Waterfront Biennial Monitoring Program.

March 1, 2022

Prepared By: Chris Comeau, FAICP-CTP Transportation Planner Public Works Engineering

#### **Executive Summary**

Since 2006, the Transportation Report on Annual Mobility (TRAM) has provided an annual assessment of Bellingham's multimodal transportation system in terms of its ability to accommodate the amount of growth and development planned for in the Land Use Element of the Bellingham Comprehensive Plan. This is done by measuring the multimodal transportation needs of new growth and development against the adopted "Level of Service (LOS) Standard" in the Multimodal Transportation Chapter of the Bellingham Comprehensive Plan, as required by the Washington State Growth Management Act (GMA). As detailed in the Multimodal Transportation Chapter, Bellingham's adopted LOS citywide is Person Trips Available (PTA) by Concurrency Service Area (CSA), which includes metrics for people walking, biking, riding transit, driving vehicles, and using regional trails.

The TRAM provides an opportunity to identify **'over the horizon'** concurrency issues proactively and offer recommendations for changes to the program, when and where necessary. In addition to tracking transportation impacts from new development, the TRAM provides an assessment of the existing multimodal transportation system to help Public Works, the Transportation Commission, and City Council plan future transportation infrastructure investments for the City's annual <u>6-Year Transportation Improvement Program (TIP)</u>. RCW 35.77.010 requires that the City adopt the 6-Year TIP by July 1 each year and the TIP must be consistent with the Transportation Element of the Bellingham Comprehensive Plan. The TRAM documents annual improvements to, and completeness of, Bellingham's pedestrian, bicycle, transit, and vehicle networks as well as recognizing that the multiuse Greenways trails provide a secondary transportation function in some parts of Bellingham. The TRAM serves as an annual progress report on how Bellingham provides mobility for people, goods, and services.

The 2021 TRAM is consistent with the 2016 Bellingham Comprehensive Plan and reflects Bellingham's "Complete Networks" transportation planning policies, hierarchy of transportation modal priorities, as well as transportation mode share trends and mode shift goals. The TRAM includes chapters on Bellingham's pedestrian, bicycle, transit, automobile, and freight truck networks, as well as a chapter on the Bellingham Transportation Fund (T-Fund), which serves as the annual T-Fund Report to the City Council. The last chapter in the 2021 TRAM is the 2021 Waterfront District Biennial Transportation Monitoring Report, completed in accordance with the Planned Action Ordinance (PAO) for the Waterfront District Master Plan. The Port of Bellingham is required to produce a full Biennial Monitoring Report every two years (next update at end of 2023; to be included in 2024 TRAM) to monitor transportation impacts and mode shares entering and exiting the Waterfront District as redevelopment occurs, which will lead to various transportation infrastructure mitigation measures agreed to by the Port and the City. Explanation of Bellingham's multimodal transportation planning programs and resources are available on the City of Bellingham Transportation Planning web page.

**COVID-19:** The City of Bellingham has been dealing with the unprecedented circumstances from the COVID-19 global pandemic and its effect on transportation, the local economy, and public health. The long-term effects on individual mobility and the multimodal transportation system are still unknown, but Chapter 2 (p 15) includes some discussion of transportation impacts resulting from COVID-19 global pandemic, March 2020 to March 2022. Chapter 8 includes charts showing the dramatic decrease in transit ridership that WTA has experienced.

Questions about the TRAM and Bellingham's multimodal transportation planning should be directed to:

Chris Comeau, FAICP-CTP, Transportation Planner
Bellingham Public Works Engineering

#### Chapter 1: Observations and Implications of the 2022 TRAM

**Urban Villages (Green):** As **Table 3.1** shows, there are more Person Trips Available (PTA) [10,600] in the central urban core **CSA #7**, which includes the Downtown, Old Town, Samish, and Fountain Urban Villages, than in any other part of the City. This is due to the high degree of completeness of the primary pedestrian network **(90%)**, availability of bicycle facilities planned in the Bicycle Master Plan **(62%)**, the presence of multiuse recreational trail connections relative to the planned bicycle facilities **(14%)**, and the prevalence of high-frequency transit routes running through the core urban villages to the downtown WTA transit station on Railroad Avenue.

Institutional Master Planned Areas (Blue): There are 3 Institutional Master Plan areas in Bellingham, which have distinct mixed-use characteristics and special populations that they are serving: Western Washington University; St. Joseph's Hospital; and Whatcom Community College.

Transition Areas (Yellow): Prior to 2020, the Bellingham Waterfront District **CSA** #6 had the lowest number of PTA for any of the Type 2 transition areas in Bellingham, but in July 2019, the City opened the Granary-Laurel arterial street, sidewalk, and off-street cycle track from Roeder Avenue to Cornwall Avenue. While this has added significant multimodal capacity, CSA #6 cannot evolve to a Type 1 CSA merging with the 4 core urban villages in CSA #7 until WTA high-frequency transit service is available. A transit ridership base will not develop in the Waterfront District until there is significant new development, which is not expected for many years to come.

**Suburban Areas (Red):** In 2018, the City annexed CSA #19 "Airport Industrial," which has fewer PTA than other CSAs as it is heavily auto-oriented. WTA did initiate transit service to the Airport, however. It should also be noted that the 2012 Pedestrian Master Plan (PMP) did not include the Bellingham UGA and annexations completed after 2012 are not part of the primary pedestrian network. This will need to be addressed as the PMP and BMPs are updated in 2022-2023.

**Citywide:** Over time, private development will continue to contribute toward the completion of sidewalks on public streets and bicycle facilities along arterial streets. This occurs through private funding and construction of street frontage improvements and through the payment of multimodal transportation impact fees. All these future improvements will add PTA to CSA's, but if there are not enough PTA to serve new development at the time of concurrency evaluation, then developers may need to earn PTA through **concurrency mitigation** in order for the City to issue a Certificate of Concurrency. Concurrency mitigation can include off-site construction of sidewalk or bicycle facilities identified in the Primary Pedestrian and Bicycle Networks in the Pedestrian and Bicycle Master Plans.

Over time, the City will continue to construct capital street improvements, adding sidewalks, bicycle facilities, streets, and transit connections, but much of this depends on grant funding available from state and federal agencies. We do not yet know how significantly the COVID-19 pandemic will impact local transportation behavior and trends. See Chapter 2 (p 15) and Chapter 8 discussion of known transportation impacts from March 2020 to March 2022 as a result COVID-19 global pandemic.

The most important ingredient of the significant progress that Bellingham has made in completing pedestrian and bicycle infrastructure has been the <u>Bellingham Transportation Fund (T-Fund)</u> [See Chapter 6], which was renewed by voters in November 2020 with 82% approval. The T-Fund will continue to provide dedicated local sales tax funding for street resurfacing, non-motorized transportation, transit-supportive capital improvements, and transportation-related climate change initiatives through December 2030.

**General Conclusion:** The 2022 TRAM demonstrates that Bellingham's Multimodal Transportation Concurrency methodology is integrating multimodal transportation system capacity within various land use contexts. This helps to promote the Bellingham Comprehensive Plan and GMA goals to direct new development toward compact, mixed use urban areas where adequate multimodal transportation services and facilities are most available.

#### **TRAM Recommendations Completed and Moving Forward**

Each year, the TRAM reports on what was accomplished over the past year and what type of transportation planning is recommended for staff to focus on in the year ahead.

#### A. Actions Taken, Considered, or Recommended from 2021 TRAM

#### 1) Maintain and Update the Concurrency Evaluation Tracking Tool with new data

- No new traffic counts or WTA transit data were included in the 2021 TRAM due to COVID-19
- See Chapter 2 (p 15) and Chapter 8 discussion of known transportation impacts from March 2020 to March 2022 as a result COVID-19 global pandemic.

#### 2) Monitor Multimodal Transportation Concurrency Methodology for Effectiveness

- Continue to publish TRAM and annually report observations of system effectiveness
- This is an on-going and annual procedure. All TRAC/TRAM documents 2006 2021 are available at <a href="http://www.cob.org/services/planning/transportation/Pages/multi-modal-trac.aspx">http://www.cob.org/services/planning/transportation/Pages/multi-modal-trac.aspx</a>

#### B. 2022 recommendations

#### 1) Update Pedestrian and Bicycle Master Plans

#### In March 2022, the City will:

- Begin a 16-month public process to update the 2012 Pedestrian Master Plan and 2014 Bellingham Master Plan to incorporate the 2021 ADA Transition Plan and the entire Bellingham Urban Growth Area (UGA).
- Announce a wide spectrum of opportunities for the public to participate in the plan update process.

#### 2) Update Transportation Impact Analysis (TIA) for Development Review

- Bellingham's TIA guidelines are in need of revision and will be updated in 2022-2023.
- Policy direction included in adopted Transportation Chapter of the 2016 Bellingham Comprehensive Plan:

#### Policy T-25

Develop innovative new methodology to measure, forecast, and mitigate negative impacts that new vehicle traffic may have on pedestrians, bicyclists, and public transit bus service when Transportation Impact Analyses are completed for new development.

#### 3) Simplify Concurrency Tracking and Monitoring System and Consolidation of CSA's

- Simplify the automobile and transit inputs to the Concurrency Evaluation Tracking Tool to reduce the amount of time required to collect, analyze, and prepare the TRAM document each year.
- Reduce the overall number of CSAs from 20 to 15 by combining some of the CSA's that are of similar typology and are unlikely to experience noticeable changes from year-to-year. Examples: Retain the 3 Type 1 CSAs and the 3 Type 1a CSAs, but consolidate Type 2 CSAs into just 4 and Type 3 into just 5, for a total of 15 CSAs citywide.

#### Chapter 2: Bellingham's Multimodal Transportation Planning Approach

#### **Complete Networks Policies**

In 2004-2005, just as the national "Complete Streets" movement rose to popularity, Bellingham created its local prototype of a complete-streets approach to transportation planning by expanding the focus of citywide transportation planning to include multiple modes of transportation (*multimodal*) with goals, policies, and project recommendations to accommodate pedestrians, bicyclists, and transit riders, as well as vehicle drivers on public streets. Bellingham worked directly with Whatcom Transportation Authority (WTA) in the development of the 2004 WTA Strategic Plan and adopted the WTA Primary Transit Network into the 2006 Bellingham Transportation Element. In addition to the citywide arterial street network, Bellingham created a citywide Freight Truck Route Network in 2007, a Primary Pedestrian Network in 2012, and a Primary Bicycle Network in 2014. From 2004-2016, Bellingham's prototypical complete-streets approach has evolved into "Complete Networks" policies for citywide multimodal transportation planning. The ultimate goal of Bellingham's Complete Networks Program is to complete, maintain, and enhance each modal network over time.

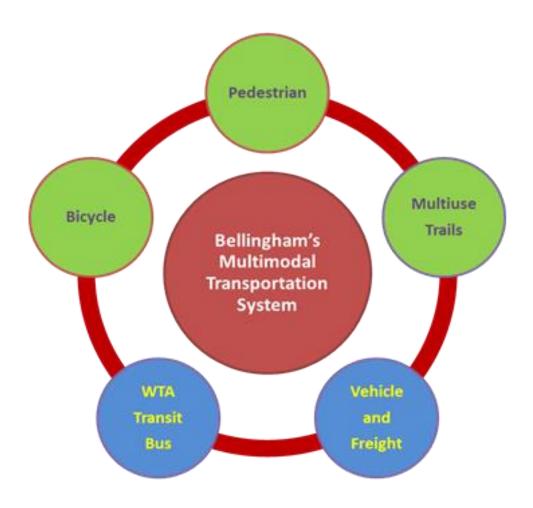

Figure 2.1. - Bellingham's "Complete Networks" Policies for Transportation Planning

#### **Transportation Modal Hierarchy**

A fundamental component of Bellingham's Complete Networks approach to transportation planning is a transportation modal hierarchy, which prioritizes the needs of the most vulnerable users (pedestrians and bicyclists) above the needs of less vulnerable (motorized) users. Bellingham has adopted a transportation policy for modal priority in the Transportation Chapter of the 2016 Bellingham Comprehensive Plan to:

Policy T-6: Design multimodal transportation improvements on existing and new streets with the *safety and mobility needs of all user groups considered* and with priority emphasis placed on the most vulnerable user groups", as illustrated in Figure 2., below. A fundamental tenet of this policy is that while Bellingham emphasizes creating physical space to accommodate safe and comfortable travel for vulnarable users, the multimodal transportation system must continue to work for all user groups, including vehicles.

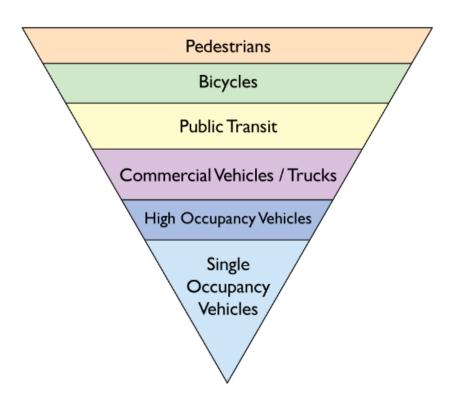

Figure 2.2. - Bellingham's Transportation Modal Priorities

Bellingham's 2012 Pedestrian Master Plan and 2014 Bicycle Master Plan each include extensive sidewalk, pedestrian crossing, bikeway, and bicycle crossing project lists, which are prioritized to maximize connectivity benefit for these most vulnerable user groups. In addition, Bellingham requires private developers to fund and construct sidewalks and bike lanes on all new or reconstructed arterial streets. When Bellingham Public Works engages in maintenance or repair of arterial streets, opportunities to include improvements identified in the Pedestrian and Bicycle Master Plans are always considered. Bellingham transportation planners also prioritize improvements identified in the Pedestrian and Bicycle Master Plans when seeking state or federal grants for transportation improvements. Lists of sidewalk, crossing improvements, and bikeway projects completed with local street and TBD funds, state and federal grant funds, as well as private and partnership funds, are included in Chapters 4, 5, and 6.

#### **Transportation Mode Share Trends and Long-Term Mode Shift Goals**

In 2006, Bellingham adopted long-term transportation mode shift goals, which were updated and readopted in the 2016 Bellingham Comprehensive Plan. These are <u>long-term aspirational goals</u> for transportation mode shift, are consistent with City Council Legacies and Strategic Commitments, and are designed to increase the mode shares for people walking, biking, riding transit, and sharing rides to work, while decreasing the number of people driving single occupant vehicles to work. Advancements in technology (Some borne out of COVID-19) are very likely to allow an increase in the number of people working from home, which may reduce single occupant vehicle trips to work. Bellingham expects walking and bicycling for short, local, and non-work trips to increase in tandem with sidewalk and bicycle network completeness as well as increases in density of land use throughout the city.

Figure 2.3, below, illustrates transportation mode share trends for work trips from 2000 through 2019 based on American Community Survey data published by the U.S. Census Bureau. The long-term trends establish Bellingham's baseline and the aspirational targets are goals to aim for in the future based on City plans. However, many factors that affect individual transportation mode choice are beyond the control of City of Bellingham policies and some of the aspirational goals may not be achievable without significant changes to regional land use and economic realities, which currently make vehicle travel the dominant transportation mode choice.

## Historic (2000-2017) Transportation Mode Shares and Long-Term (2026-2036) Transportation Mode Shift Goals

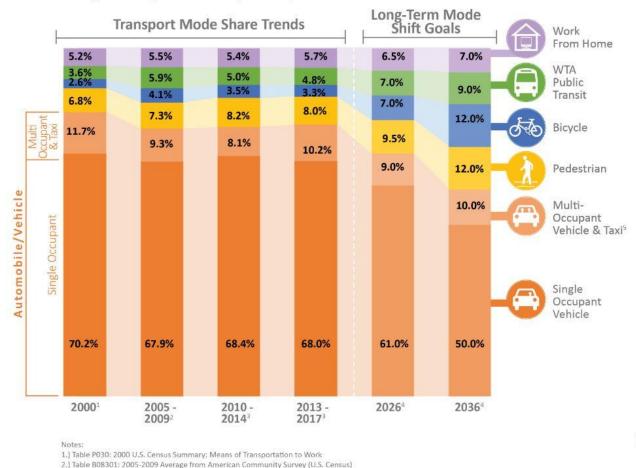

Figure 2.3. - Bellingham's Aspirational Long-Term Transportation Mode Shift Goals

3.) Table 50801: 2010-2014 & 2013-2017 Average from American Community Survey (U.S. Census)
4.) 2016 baseline and long-term mode shift goals [Monitor annually in TRAM; update goals in 2026 Comp Plan]

5.) Taxi includes ridesharing organizations, such as "Uber" and "Lyft"

#### Observations of Transportation Mode Share and Local Economic Trends in 2020 (Prior to mid-March 2020)

Public Works tracks and monitors annual progress toward achieving the long-term aspirational goals, which allows Bellingham to make strategic transportation planning adjustments if trends indicate that the City is not making progress toward its long-term transportation mode shift goals. Any transportation policy or funding adjustments need to be weighed carefully against some very important realities about Bellingham's role in the regional transportation system, including but not limited to:

- Bellingham's economy and transportation funding is heavily reliant on sales tax revenue, including:
  - o City of Bellingham General Fund, Street Fund, and Transportation Fund (2/10<sup>th</sup> of 1%);
  - Whatcom Transportation Authority Public Transit Benefit Area Levy (6/10<sup>th</sup> of 1%)
- Bellingham is the regional center for employment, shopping, medical services, education, recreation, and entertainment. Regional trips made for all of these purposes are primarily vehicle trips due to the distances traveled and the convenience of the private automobile compared to fixed route transit.
- Lower consumer costs and lower taxes attract automobile trips by Canadian shoppers to Bellingham. The primary example is gasoline, which in lower mainland B.C. after adjusting for taxes, metric conversion, and currency exchange currently costs \$5.00 U.S. dollars per gallon. This is more than twice as expensive than gas purchased at Costco or Fred Meyer in Bellingham for less than \$2.50 per gallon. Other major cost differentials include dairy and meat (due to U.S. subsidies for agricultural products).
- Online shopping has increased and become part of everyday lifestyle for local and regional consumers. For the past 15 years, online retail shopping has grown annually as a percentage of local sales tax generation. As shown in Figure 2.4, below, the initial impact of the COVID-19 global pandemic depressed sales tax revenue, but the cumulative effect of stay-at-home orders, travel restrictions, and limits on indoor events and gatherings, led to a pandemic-induced surge in online retail shopping. The City of Bellingham experienced a 16% increase in sales tax revenue from 2019 through 2021.

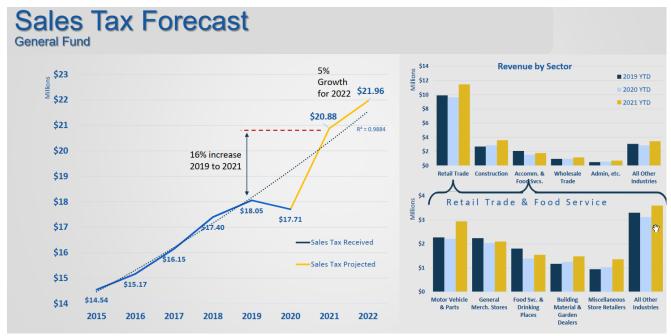

Figure 2.4. Growth in sales tax revenue in Bellingham, largely from COVID-induced online shopping

- Bellingham's population (City limits + unincorporated UGA) continues to grow at a rapid pace
  - City and UGA combined population has grown by over 30% in the past 20 years from 77,000 in 2000 to 101,588 in 2020 (Source: OFM, April 1, 2020) and has more than doubled since 1980.
  - Demographic data indicates that the local population is aging as the "Baby Boomer" generation chooses places like Bellingham for retirement.
- COVID-19 untethered many employees from physical office locations in expensive housing markets.
  - COVID led to a surge in companies allowing employees to work remotely, which induced geographic
    migration to reside in more affordable locations with lifestyle amenities, such as Bellingham, with its
    active outdoor recreation culture (Ski/Snowboard, Mountain/Road Bike, Hike/Backpack/Camp,
    Boat/Sail, Sea Kayak/Paddle Board). In planning lingo, these places are referred to as "Zoom Towns."
- Bellingham housing has become much less affordable for local wage workers, which has resulted in surging home sales in Ferndale, Birch Bay, Blaine, Lynden, and Everson as well as rural Whatcom County. For those employed in Bellingham, this translates to increased regional vehicle-based trip making.
  - This is being exacerbated by the COVID-induced influx of untethered workers (see above) whose employers are located outside of Bellingham as their income allows them to out-compete local wages earners for housing stock.

#### Transportation Mode Shares 2015-2019\* (5-Year Average) \*Pre-COVID-19

Up until mid-March 2020, the national and regional economies were very strong and had been for many years. Historically, individuals with more disposable income purchase more automobiles, which translates to higher vehicle miles traveled. This has been the trend for many years and, coupled with historically low gasoline prices, has translated into more reliance on automobiles. Figures 2.5 and 2.6 below provide a closer look at all rolling 5-year averages and illustrate that compared to 2013-2017, the 2015-2019 5-year averages show that:

- Single Occupant Vehicle (SOV) mode share decreased (-0.9%) to 69.2%
- Multi-Occupant Vehicle (MOV) mode share remained stable (+0%) at 8.9%
- WTA Public Transit mode share increased (+0.3%) t0 5.1%
- Bicycle mode share increased (+0.3%) to 3.9%
- Pedestrian mode share decreased significantly (-0.6%) to 6.5%, and
- Work at home mode shares increased (+0.9%) to 6.4%.

Decreases in mode shares for walking might be consistent with the national trend of increased vehicle miles traveled, which are the result of factors that are out of Bellingham's local control, including, but not limited to:

- The increased availability of rideshare services, such as Uber and Lyft;
- A strong market economy allowing more disposable income;
- Low interest rates for automobile loans; and
- Historically cheap fuel prices (locally \$2.50/gallon).

The U.S. Census American Community Survey (ACS) data is reported as a rolling 5-year average, which allows consideration of data trends from a standardized source, rather than isolated point-in-time data collected in a variety of methods and contexts, but the downside of the ACS 5-year averages are the lag time of the data. For example, the 2014-2019 ACS mode share data is reported in December 2020, but does not yet reflect the known radical 85% decreases in WTA transit ridership in 2020 due to COVID-19 (See TRAM chapter 8), or the anticipated increase in bicycle ridership due to the significant expansion of the citywide bicycle network 2015-2020.

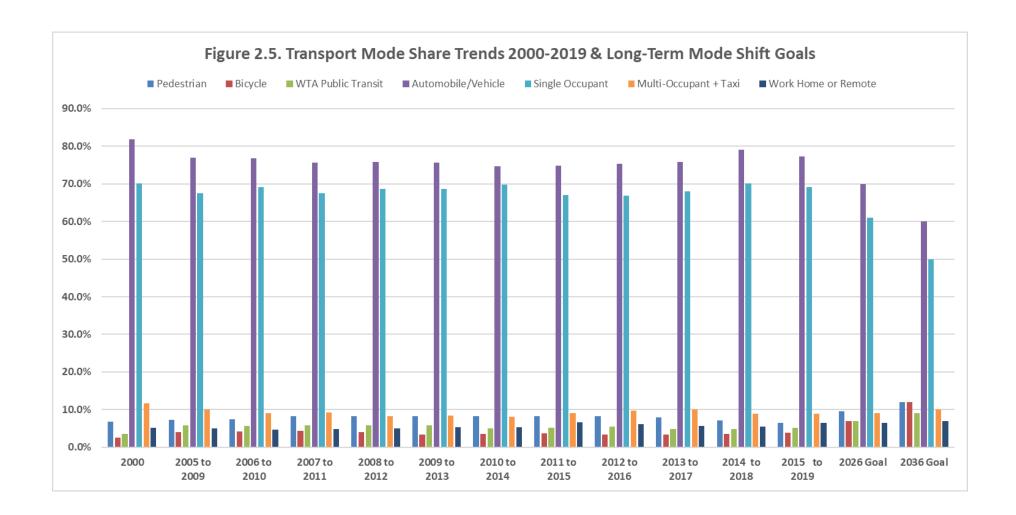

See Page 15, Discussion of transportation impacts from COVID-19 global pandemic, March 2020 to March 2022

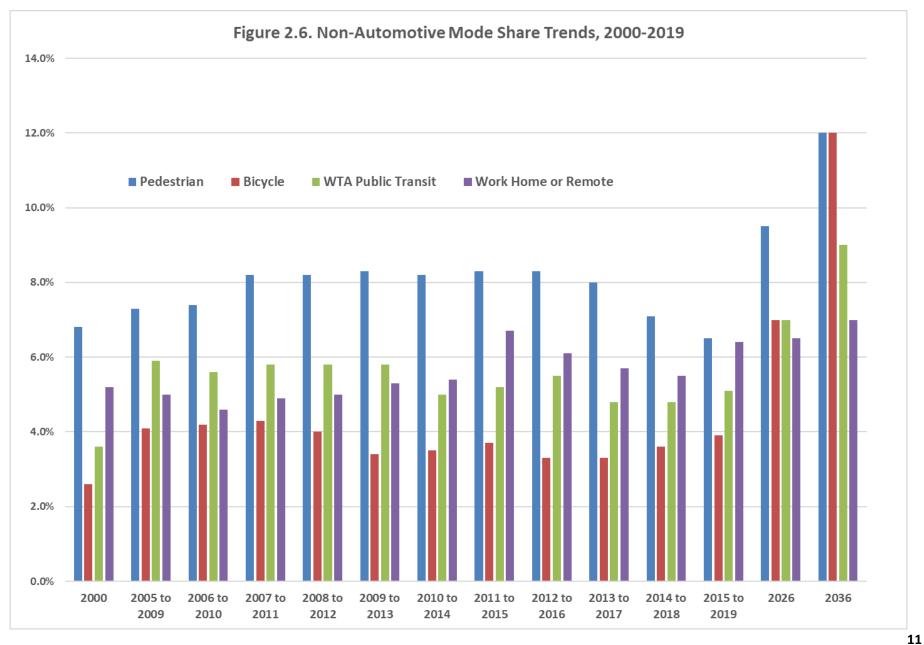

Unfortunately, according to the City's Census point of contact "The most-recent ACS Table S0801 is still the 2015-2019 version. The 2020 ACS data has had a number of release-date setbacks due to statistical sampling errors from reduced sample sizes and response rates attributed to the Covid-19 pandemic. There is an experimental 1-year 2020 dataset that has been released with a whole host of disclaimers as to it's accuracy but it only has detail at the statewide level."

Table 2.	Table 2.1. Transport Mode Share Trends 2000 - 2019 and Long-Term Mode Shift Goals (2026 & 2036)

#### NOTES:

- 1.) Year 2000 = Table P030 2000 U.S. Census Summary: Means of Transportation to Work
- 2.) Years 2005-2019 = Table S0801 U.S. Census American Community Survey 5-Year Averages Means of Transportation to Work
- 3.) Years 2026 and 2036 = Adopted Long-Term Aspirational Mode Shift Goals [Monitor annually in TRAM; Update goals in 2026 Comp Plan]
- 4.) "Multi-Occupant + Taxi includes ridesharing companies, such as "Uber" and "Lyft"
- 5.) "Bellingham + UGA Total Population = Washington Office of Financial Management "Small Area Estimates, 2014-2020"

Since the Bicycle Master Plan (BMP) was adopted in October 2014, Bellingham has completed over half (52%) of the 215 recommended bicycle network link and crossing improvements in the BMP. This is a direct result of having dedicated local funding for both street resurfacing and non-motorized transportation improvements from the Bellingham Transportation Fund (T-Fund). See TRAM Chapter 6 for more information on T-Fund. Citywide bicycle network improvements constructed from 2015-2020 are illustrated in Bikeway Connectivity Graphics available on the Bellingham Complete Networks web page.

Bellingham's rapid implementation of the 2014 Bicycle Master Plan from 2015 – 2020 garnered a great deal of positive attention and recognition both statewide and nationally with the following:

- 2020-2024 Gold-level Bicycle Friendly Community League of American Bicyclists;
- 2020 Association of Pedestrian & Bicycle Professionals national webinar (March 18, 2020);
- 2020 APA national Transportation Planning Division featured article in "State of Transportation Planning."
- 2019 Washington Governor's Smart Communities Award;
- 2019 American Planning Association Washington Award for Transportation Plan Implementation;

#### Strategic Policy Measures and Strategies to Encourage Transportation Mode Shift

Bellingham already implements many policies and strategies aimed at incentivizing walking, biking, and transit while also de-emphasizing vehicle capacity on roadways. Examples include, but are not limited to:

- Planning for high-density mixed use Urban Villages connected by high-frequency (15 min.) transit;
- Significant construction of sidewalks, flashing crosswalks, traffic signals, and on-/off-street bikeways;
- Road diets removing 12 miles of vehicle lanes and 6 miles of on-street parking to install bikeways;
- Extensive multiuse Greenways recreational trails available for secondary transportation purposes;
- BMC 13.70 Multimodal Transportation Concurrency Program integrating land use and transportation;
- BMC 19.06 Multimodal Transportation Impact Fees (TIF) directly funding pedestrian and bicycle projects;
- BMC 19.06.040 Urban Village TIF Reduction Program incentivizing mixed use infill development; and
- Voter approval of Bellingham Transportation Benefit District (2010) and Transportation Fund (2020).

#### Other Possible Measures Likely to Promote Transportation Mode Shift:

While there are many factors affecting transportation mode-choice that are out of the City of Bellingham's local control, there are several local policy measures – primarily focused on vehicle parking - that the City Council is currently discussing, which would be likely to help support Bellingham's transportation mode shift goals as well as implementation of the <u>Climate Protection Action Plan</u>.

- Increase metered parking rates. While this could be controversial, it could also be a very effective
  disincentive to driving in areas promoting walking, biking, and transit. Bellingham has always had low
  parking meter rates and has not raised rates in over 10 years. The average metered parking space costs a
  driver \$0.75 per hour. Research clearly shows that underpriced parking meter rates:
  - o Influence people to drive rather than consider other choices, such as walking, biking, or transit;
  - Influence employees to use on-street parking spaces meant for customers, clients, and visitors;
  - o Do not generate parking turn-over, which is desirable to attract customers to businesses;
  - Do not cover the cost of parking enforcement, administration, court hearings, parking facility maintenance and repair over time, or the possible funding of additional future parking structures.
- Expand parking management areas beyond Downtown and Fairhaven to more Urban Villages (Old Town, Waterfront, Fountain District, N. Samish, Barkley) as these areas continue to develop.
- Implement variable, market-based parking prices to maintain parking turn-over in high-demand, higher-priced parking locations. This could attract drivers to park in lower-demand, lower-priced parking locations, thus spreading parking demand.
- Reduce parking requirements for new development citywide. This is already built-in to many Urban Village master plans, but Bellingham land use regulations require new development to provide a minimum number of on-site parking spaces, which can create an over-supply of on-site parking spaces, which incentivizes driving. While the cost of providing on-site parking is born by the developer and then passed along to the occupants of the development via the built-in cost of rent or lease, the general perception is that on-site parking is free. The more convenient it is to park a vehicle, the more likely people will be to drive rather than consider other mobility choices, such as walking, biking, or transit.

	'n	tin	hau	novt	naaa	
L	OΠ	LIII	ueu	nexi	Daae	

• Work with Whatcom Transportation Authority (WTA) Board of Directors to study the feasibility of increasing public transit ridership by permanently eliminating the fare box in Bellingham and/or Whatcom County. For well over a century, citizens have been willing to tax themselves to help provide the social benefit of public education and, in similar fashion, the City and WTA could ask taxpayers to further subsidize transit fares, which currently only contribute 13% of overall WTA revenue, to make public transit a free social benefit. Other transit agencies in the U.S. have begun to implement free transit by eliminating the fare box, including Capitol Transit serving Olympia-Lacey-Tumwater, WA. This is both a critical social equity issue and a transportation mode shift issue because WTA transit ridership has plummeted in the past year due to COVID-19 (See Chapter 8, WTA charts).

Note: In March 2020, WTA stopped collecting bus fares from passengers to reduce contact and risk for drivers, as well as to provide essential travel for low-income passengers, but resumed transit fare collection in July 2021. At the same time that fare collection resumed, WTA initiated a program for all youth (0-17) now ride WTA buses for free.

- Support use of automated technology to collect data, improve public safety, and use law enforcement resources more efficiently. Traffic signal technology is improving and both automated cameras and detectors are becoming more sensitive to balancing demand at different times of day more efficiently. Automated cameras could be installed at intersections with high collision histories and/or high pedestrian crossing demand, in 20 mph school zones, and/or intersections where red light running is a problem. Automated cameras can be used to detect 'near-misses' involving vehicles-pedestrians-bicycles, which do not show up in collision data (Seattle and Bellevue are currently using this technology) and can count people walking and biking to support pedestrian and bicycle infrastructure improvements seeking local or outside grant funding, which would also help promote transportation mode shift.
- Continue to support the removal of on-street parking on arterial streets to allow the installation of bikeways on corridors identified in the Bicycle Master Plan, including but not limited to:
  - West Illinois Street (Sunset Drive to Lynn Street) marked bike lanes (2022-2023)
  - Meridian Street (Squalicum Parkway to West Illinois Street) marked bike lanes (2022-2023)
  - o Girard Street (Broadway Avenue to B Street) marked bike lanes (2022-2023)
  - James Street (Illinois Street to Alabama Street) marked bike lanes (2022-2023)
- Allow e-scooters and e-bike share for a trial period to test market and develop supportive regulations.
   Note: In March 2020, the City issued an RFQ seeking proposals from companies wishing to operate e-bikes and e-scooters on public streets, but due to the COVID-19 global pandemic had to rescind the RFQ. The RFQ could be re-issued when safe to do so later in 2021.
- Update the 2012 Pedestrian Master Plan and the 2014 Bicycle Master Plan in 2022-2023. **Note:** Updates to both the Pedestrian and Bicycle Master Plans are expected to begin in March 2022. With the Governor's mask mandate and restrictions on indoor gatherings to be lifted in mid-March 2022, the City and consultants are planning for genuine public engagement using both online engagement platforms, such as Engage Bellingham, as well as a variety of in-person public meeting formats, such as Public Open Houses, topic-oriented Technical Review Committee meetings, Neighborhood Association meetings, etc.
- Other possible options ........

#### **Notes About the COVID-19 Global Pandemic Effects on Transportation**

Beginning in mid-March 2020, radical, unprecedented, and transformative changes began on the local, state, and national transportation system as a result of the COVID-19 global virus pandemic. Governmental closures of activities that attract large and small groups of people together, such as employment centers, shopping centers, sports and entertainment venues, restaurants and bars, etc. have significantly altered human social activity and mobility patterns, some of which may become permanent.

#### There have been rapid and severe disruptions to local transportation systems, including but not limited to:

- Shipment of freight and goods has been affected with consumer demand out-stripping supply leading to unavailability or delays in delivery time, but less traffic congestion has been a positive for freight;
- WSDOT initially documented significant reductions in commuter vehicle traffic on Interstate 5 in/out of Seattle as many employees work from home with the same effects experienced on I-5, SR 539, SR 542, and SR 11 in/out of Bellingham, Whatcom's regional employment, shopping, & entertainment center;
- The U.S.-Canada border was closed for "non-essential" trips since mid-March 2020, which essentially extinguished Canadian travel and consumer spending activity in Whatcom County and Bellingham.
- Air travel passengers initially plummeted by 90% at the Bellingham International Airport and nationally, but has since recovered to some extent;
- Amtrak Cascade Rail passengers plummeted by 90% in Washington and on the west coast; and
- WTA transit ridership decreased 85%, fare collection was suspended, and group-oriented transit service
  was limited to essential routes for vulnerable populations in Bellingham and Whatcom County with bus
  capacity limited to 12 individual riders on each bus (See Chapter 8, WTA charts).

COVID-19 outcomes on human behavior and vehicle traffic volumes are uncertain, but it is very likely that there will be significant long-term changes to individual transportation mode choices as a result of the pandemic.

#### Outcomes that may lead to decreased reliance on single occupant vehicles for local trips may include:

- A significant increase in people telecommuting and working from home as employers embrace technological improvements in group communication platforms and work from home productivity;
- An increase in people biking for transportation trips as bicycle infrastructure expands and as electric bike battery technology improves and leads to reduced prices and increased use of e-bikes;
- Throughout the pandemic, high-density residential development has continued in Bellingham's Urban
   Villages, which may lead to an increase in walking, biking, and bus riders living in infill developments close to work, shopping, and entertainment interconnected by WTA high-frequency transit service.

#### Outcomes that could lead to increased reliance on single occupant vehicles for local trips may include:

- Low global oil prices have reduced gasoline costs below the already cheap \$2.50 per gallon;
- Low interest rates allow people to borrow money for purchases, such as new vehicles, new suburban single-family homes at the edge of town or in bedroom communities, which require driving; and
- Even after vaccines are made widely available, societal wariness of large group travel situations may result in less ridership on fixed route group transit bus service, trains, and airplanes.

#### Negative funding implications of COVID-19 that could lead to decreased transportation funding may include:

- Closure of normal activities reduced vehicle traffic and vehicle miles traveled in Spring 2020 reduced State gas tax revenue and funding available in State transportation grant programs;
- Less commercial retail and office development in 2020 resulted in a 54% decline in Transportation Impact Fee (TIF) revenue in 2020 (See TRAM Chapter 10).

As of March 1, 2022, the Russian invasion of Ukraine may reverse some of the trends listed above, such as low-cost oil and gasoline, which historically has resulted in increased transit ridership. The City will continue to monitor all of the above.

#### Chapter 3: Multimodal Transportation Concurrency Program in 2021

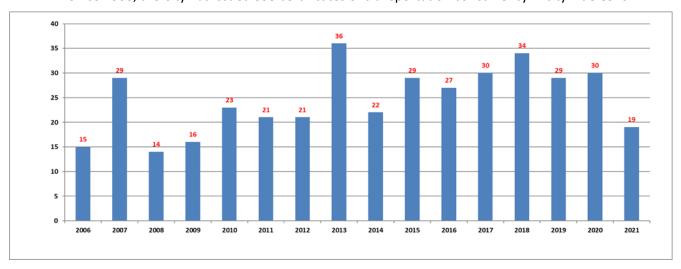

#### **Evolution From Auto-based to Multimodal Transportation Metrics**

In 2005, Bellingham transportation planners recognized that traditional auto-oriented level of service (LOS) methodology from the national Highway Capacity Manual (HCM) would not help Bellingham achieve its land use goals for infill development, but it wasn't until 2008 that Bellingham staff and consultants devised a better method to meet the Washington State's GMA transportation concurrency requirements:

Transportation element that implements, and is consistent with, the land use element (RCW 36.70A.70 (6)) and

After adoption of the comprehensive plan by jurisdictions required to plan or who choose to plan under RCW 36.70A.040, local jurisdictions must adopt and enforce ordinances which prohibit development approval if the development causes the level of service on a locally owned transportation facility to decline below the standards adopted in the transportation element of the comprehensive plan, unless transportation improvements or strategies to accommodate the impacts of development are made concurrent with the development. These strategies may include increased public transportation service, ride sharing programs, demand management, and other transportation systems management strategies. For the purposes of this subsection (6) "concurrent with the development" shall mean that improvements or strategies are in place at the time of development, or that a financial commitment is in place to complete the improvements or strategies within six\* years. (RCW 36.70A.70 (6) (b)). [\*Bellingham requires financial commitment within 3 years consistent with project funding on 6-Year TIP]

In 2009, Bellingham implemented its innovative <u>Multimodal Transportation Concurrency Program</u>, which received the **2009 APA/PAW Award for Transportation Planning in Washington State**. A full account of Bellingham's evolution from traditional auto-based metrics to innovative multimodal transportation metrics is available in an article titled <u>Moving Beyond the Automobile</u> on the City web site.

Since 2006, the City has issued 395 certificates of transportation concurrency in citywide CSAs.

Figure 3.1. Annual Concurrency Certificates Issued from June 15, 2006\* - December 31, 2021

<sup>\*</sup>NOTE: BMC 13.70 effective date = June 15, 2006 with adoption of 2006 Bellingham Comprehensive Plan.

Bellingham's Multimodal Transportation Concurrency Program annually measures sidewalks, bicycle facilities, multiuse trails, WTA transit service, and arterial streets in the context of various land use environments found within 20 Concurrency Service Areas (CSA) across the city (*Figure 3.2.*).

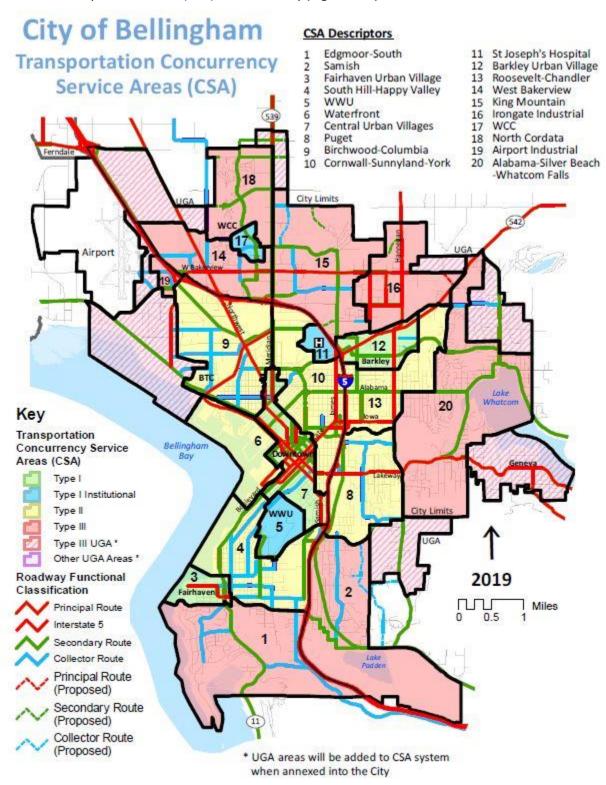

Figure 3.2. Bellingham's 20 Concurrency Service Areas (CSA) in 2020

#### **Notes:**

- 1.) "Percent complete" sidewalks reflects degree of completeness by CSA of "Primary Pedestrian Network" in 2012 Pedestrian Master Plan from the list of 343 sidewalk infill and crosswalk projects.
- 2.) "Percent complete" bikeways reflects degree of completeness by CSA of "Primary Bicycle Network" in 2014 Bicycle Master Plan from the list of 186 Bikeway improvement projects.
- 3.) In June 2021, WTA adjusted transit service on some routes in Bellingham. In February 2022, the WTA Board approved a 20-year long-range transit plan titled WTA 2040.
- 4.) PTA for WTA transit and Auto/Vehicle are derived from select transit and vehicle data collection measurement points on arterial streets throughout the City. Transit data is collected by WTA and Auto data is collected by Public Works. WTA and auto count data from 2019 due to radical changes in transit ridership and auto travel from COVID-19 global pandemic.
- 5.) Annual net PTA is derived from the compilation of all five variables (Sidewalk, Bike Lane, Multiuse Trails, WTA Transit, and arterial traffic counts); minus PTA used by development proposals; minus a 500 PTA reserve in each CSA to avoid violating Bellingham's adopted multimodal LOS standards.

See Chapter 7 (p 49) for an explanation of how multi-use trails are defined for inclusion in Concurrency.

#### **Compliance with Washington State Planning Law**

The Transportation Report on Annual Mobility (TRAM) is an annual monitoring and reporting system that Public Works has published since March 2006 (previously titled Transportation Report on Annual Concurrency (TRAC). The TRAM informs the City Council, Planning Commission, Transportation Commission, the general public, and the development community which portions of the City are best suited for infill development based on adequate transportation infrastructure and services - reported as Person Trips Available (PTA) by each Concurrency Service Area (CSA) (See Table 3.1.). As such, the TRAM is Bellingham's annual documentation that the City is in full compliance with the Washington State Growth Management Act (GMA) requirements.

In November 2016, the City of Bellingham adopted an update to the <u>Bellingham Comprehensive Plan</u> and in the Multimodal Transportation Chapter, the City re-adopted its multimodal level of service (LOS) standards and BMC 13.70 as its Multimodal Transportation Concurrency Ordinance, as follows:

**Policy T-21** Calculate "**Person Trips Available by Concurrency Service Area**" as Bellingham's adopted LOS standard to serve planned growth in different parts of the City. Per BMC 13.70 Multimodal Transportation Concurrency, Bellingham and the UGA are divided into Concurrency Service Areas (CSA) based on differing land use contexts and multimodal LOS is calculated for each CSA using the following performance measurements:

- Completeness of sidewalk network;
- Completeness of bicycle network;
- WTA transit capacity, transit route frequency, and transit ridership;
- Vehicle traffic volume to capacity; and
- Access to multiuse trails.

The City's LOS standards provide measurable criteria to judge the adequacy of the multimodal transportation system for new development by calculating person trips available for transportation concurrency evaluations, which are a pre-application requirement. As required by GMA, new development will be prohibited unless adequate person trips are available or multimodal transportation system improvements are made concurrent with the development. While adding vehicle capacity to an arterial street or intersection may be necessary in some circumstances, continual road widening is not a long-term solution to p.m. peak (rush-hour) traffic congestion. The City's transportation policies are focused on managing the multimodal transportation network safely, efficiently, and sustainably for all modes without unnecessarily widening arterial streets simply to add capacity for automobiles.

**Policy T-22** Publish an annual report on adopted LOS standards and adequacy of the Citywide transportation system according to its Multimodal Transportation Concurrency Program (BMC 13.70) and the TRAM.

The **2021 TRAM** demonstrates that Bellingham's Multimodal Transportation Concurrency methodology is integrating multimodal transportation system capacity within various land use contexts in Bellingham and is further promoting both the Comprehensive Plan and GMA goal of directing new development toward compact, mixed-use urban areas where adequate transportation services and facilities are most available.

#### Chapter 4: Primary Pedestrian Network Completeness - 2021

Since 2006, pedestrian improvements have been listed in the Transportation Element of the Bellingham Comprehensive Plan. Planning for <u>Bellingham's Pedestrian Master Plan</u> (PMP) began in March 2011, included significant public involvement from residents of every neighborhood, and was approved by City Council in August 2012. The 2013 Transportation Report on Annual Mobility (TRAM) first reported the completeness of the Primary Pedestrian Network (Figure 4.2) by Concurrency Service Area (CSA). Table 4.2., below, shows how complete the citywide Primary Pedestrian Network was at the end of 2021. The degree of completeness varies in different parts of the City, as shown in Figures 4.3, 4.4, 4.5 and Table 4.2. The PMP includes over 405 sidewalk and crossing improvement projects with planning level\* cost estimates of \$333 million\* (2020 dollars), or more, over time. [\*Does not include cost of stormwater, environmental-critical areas mitigation, or right-of-way acquisition].

Since 2011, many sidewalk and crosswalk projects have been constructed with Bellingham Transportation Funds (T-Fund) (Table 6.2.), but Bellingham Municipal Code (BMC) street standards also require private developers to construct ADA-compliant sidewalks for any new development on public streets and state and federal grant funding agencies require sidewalks to be included on all arterial street improvement projects. Public Works staff has been very successful at leveraging local funding to receive outside state and federal grant funding whenever possible. Occasionally, pedestrian projects can be added to other City-funded work (maintenance, storm water, Parks, etc.) that is being conducted. In addition, pedestrian improvements are sometimes funded with a combination of the above as well as funding from other public agencies and/or private development interests.

Since 2011, a significant number of improvements to the Primary Pedestrian Network listed in Tables 4.1. and 4.2., below, have been or are expected to be constructed by Public Works and private development interests. Over half (58%) of the 57 pedestrian crossing improvements in the PMP have been completed or are programmed for funding in the 6-Year TIP by 2023. In contrast, only a small portion (16%) of the 357 sidewalk projects have been constructed or are programmed for funding in the 6-Year TIP by 2023. This is because many of the crossing improvements also support bike boulevards and have been implemented with Bicycle Master Plan (BMP) projects as well. Sidewalks are always 100% new construction, must be built to ADA standards, include storm water conveyance and treatment requirements, often include moving large utility poles, can include environmental impacts, critical area permits, and mitigation, and, in some cases, right-of-way acquisition, which can be very expensive and take a very long time to complete. Construction costs for concrete sidewalks have increased significantly since 2011.

Pedestrian Crossing Improvements	Tier 1	Tier 2	Tier 3	Total
Percent Completed	71%	40%	60%	58%
Projects Completed	12	6	15	33
Projects Not Yet Completed	5	9	10	24
Total Crossing Projects	17	15	25	57
*Crossing at SR 539/Tremont unlikely				

Sidewalk Improvements	Tier 1	Tier 2	Tier 3	Total					
Percent Completed	35%	20%	12%	16%					
Projects Completed	15	7	34	56					
Projects Not Yet Completed	28	28	245	301					
Total Sidewalk Projects 43 35 279 357									
*Some sidewalk projects divided into pieces for funding and constructability									

#### Improving Social Equity by Providing Sidewalks, Bikeways, and Crossings in Low-Income Neighborhoods

Public Works incorporates social equity and socio-economic needs into all multimodal transportation plans. Low-income housing, social services, and public transit needs were weighted heavily in the project prioritization process for the Pedestrian and Bicycle Master Plans and Whatcom Transportation Authority (WTA) specifically focused on under-served populations in the 2016 WTA Strategic Plan Update, which is also incorporated into Bellingham's multimodal transportation planning and the annual six-year Transportation Improvement Program.

Figure 4.1. shows Bellingham's "Low to Moderate Income Neighborhoods" from the <u>2013-2017 Bellingham</u> <u>Consolidated Plan</u> and Tables 4.1. and 4.1.a. highlight pedestrian projects that have been or will be completed in these neighborhoods using the same orange-color shading as Figure 4.1.

The <u>2016 Bellingham Comprehensive Plan Multimodal Transportation Chapter</u> includes the following goals and policies addressing environmental justice:

**GOAL T-6** Ensure that social equity needs are addressed in all transportation projects.

**Policy T-31** Provide accessible pedestrian and bicycle facilities for all through equity in public engagement, service delivery, and capital investment.

**Policy T-32** Through a balanced prioritization process, invest in pedestrian and bicycle infrastructure in all Bellingham neighborhoods.

**Policy T-33** Provide opportunities for Bellingham residents regardless of age, gender, ethnicity or income to engage in pedestrian and bicycle related activities.

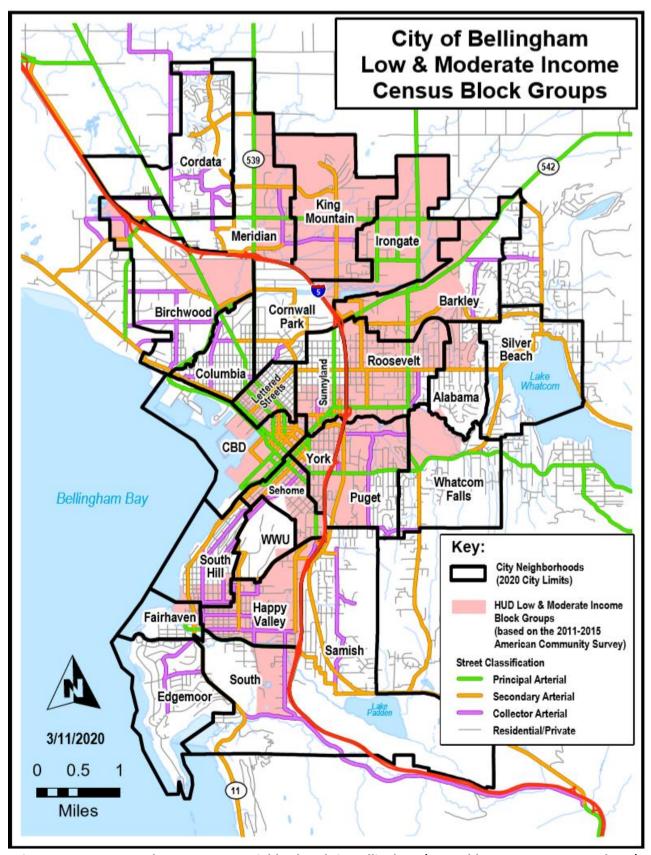

Figure 4.1. Low to Moderate Income Neighborhoods in Bellingham (See Tables 4.1., 5.1., 6.2., and 6.3.)

Table 4.1.	Table 4.1. Pedestrian Improvements Constructed Primarily With Street Fund, State & Federal Grants, Partnerships, or Private Development - 2011 through 2018

<sup>\*</sup> Current Primary Pedestrian Network includes the PPN adopted in the 2012 Master Plan as well as segments added since plan adoption through annexation, or new capital projects (i.e. Waterfront District)

#### Chapter 5: Primary Bicycle Network Completeness - 2022

Since 2006, bicycle facility improvements have been listed in the Transportation Element of the Bellingham Comprehensive Plan. Planning for <u>Bellingham's Bicycle Master Plan</u> (BMP) began in March 2013, involved bicyclists and residents from every neighborhood, and was approved by City Council in October 2014. The 2015 TRAM provided the first report on the completeness of the Primary Bicycle Network (Figure 5.2) by Concurrency Service Area (CSA). The degree of network completeness varies in different parts of the City, as shown in Figures 5.3, 5.4, 5.5, and Table 5.2. The BMP includes 189 bicycle network links and 26 crossing improvement projects (total 215 projects) that are estimated to cost between \$65 million\* (2020 dollars) over time. [\*Does not include cost of stormwater, environmental-critical areas mitigation, or right-of-way acquisition].

Since 2011, Public Works has constructed significant improvements to the Primary Bicycle Network, as shown in the chart below, Tables 5.1, 5.4, and 6.3. Many of these bicycle improvements have been constructed with TBD funds, as listed in Table 6.3 in Chapter 6 Transportation Fund. Public Works has also constructed many bicycle improvements with non-TBD funds, as listed in Table 5.4, below.

Bicycle Network Improvements	Tier 1	Tier 2	Tier 3	Crossings	Total					
Percent Completed	63%	60%	43%	69%	52%					
Projects Completed*	15	34	51	18	118					
Projects Not Yet Completed	9	23	69	8	109					
Total Bike Projects 24 57 120 26 227										
*Includes "I	* Includes "Further Study Needed" Links									

#### Why Have There Been More Bike Projects Than Pedestrian Projects?

There are several reasons why bikeway improvement projects have out-paced pedestrian improvement projects for completion and funding from 2011-2020, including:

- The adopted Primary Pedestrian Network is 260 miles vs. the 170-mile adopted Primary Bicycle Network;
- The Pedestrian Master Plan has 405 individual projects vs. 215 projects in the Bicycle Master Plan;
- On-street bikeway improvements are primarily between curbs on existing streets with little-to-no new environmental impacts and can be made in several ways, as listed below;
  - o Resurfacing existing roadways sometimes allows bikeway facilities to be installed at relatively low cost;
  - Rechannelizing existing roadways allows bikeway facilities to be installed at relatively low cost;
  - Road diets (removal of vehicle lanes) can allow bikeway facility installation at relatively low cost;
  - Removal of on-street arterial parking can allow bikeway facility installation at relatively low cost;
  - Some bikeway improvements are funded with a combination of water/sewer/storm water funds, as well as other public agencies and/or private development interests;
- New sidewalks always create new impervious surface, which must be treated for storm water quantity and quality and require underground storm water drains and conveyance system tied into a network;
- New sidewalks may require additional right-of-way (property) to be purchased, which is extremely time-intensive, expensive, or in some cases, not financially feasible;
- New sidewalks in sloped areas may require retaining walls on one or both sides, which is very expensive;
- While all new arterial streets are required to have both sidewalks and bike lanes, whether by local, state, federal, or private funding, there are environmental circumstances (see above) where having sidewalk on only one side of a street may be the only financially feasible way to provide a pedestrian pathway.

### Bellingham has removed over 11 miles of vehicle lanes in favor of installing over 12 miles of marked and buffered bike lanes (See below). Note: Green line in each table divides pre- and post-Bicycle Master Plan implementation.

		Road Diet R	eduction of Vehicle Lane Capacity Resulting in Bicycle Facility	Installation			
Year	Arterial Street	Project Extent	Before and After Road Diet Street Configuration	Vehicle Lane Miles Removed	Bicycle Facility	Buffer Width	Bike Lane Miles Installed
2002	N. State Street	York to Wharf	3 one-way vehicle lanes to 2 lanes + bike lane	0.79	Buffered bike lane <sup>1</sup>	2	0.79
2003	Magnolia Street	Commercial to Ellis	3 one-way vehicle lanes to 2 lanes + bike lane	0.45	Buffered bike lane <sup>2</sup>	2	0.45
2004	Broadway Avenue	Holly to Sunset	4 vehicle lanes to 3 lanes + bike lanes	0.76	Marked bike lane	~	1.52
2010	Forest Street	Wharf to York	3 one-way vehicle lanes to 2 lanes + bike lane	0.79	Marked bike lane	~	0.79
2015	Alabama Street	Cornwall to James	4 vehicle lanes to 3 lanes + bike lanes	0.46	Marked bike lane	~	0.92
2018	Barkley Boulevard	Newmarket to Sussex	4 vehicle lanes to 2 lanes + buffered bike lanes	1.21	Buffered bike lane	4	1.21
2019	Chestnut Street	Bay to Ellis	3 one-way vehicle lanes to 2 lanes + buffered bike lane	0.68	Buffered bike lane	4	0.68
2019	Cordata Parkway	Kellogg to Kline	4 vehicle lanes to 2 lanes + buffered bike lanes	3.03	Buffered bike lane	4	3.03
2020	Samish-Maple-Ellis	Bill McDonald to Lakeway	5 lanes to 3 lanes + buffered bike lanes	1.65	Buffered bike lane	4	1.65
2020	Ellis-York	Lakeway to Cornwall	4 vehicle lanes to 3 lanes + buffered bike lanes	1.23	Buffered bike lane	4	1.23
				11.05			12.27

#### Bellingham has removed over 6 miles of parking lanes in favor of installing over 12 miles of marked and buffered bike lanes (See below).

		Removal	of Vehicle Lane Parking Capacity Resulting in Bicycle Facility In	stallation			
Year	Arterial Street	Project Extent	Before and After Parking Removal Street Configuration	Parking Lane Miles Removed	Bicycle Facility	Buffer Width	Bike Lane Miles Installed
2008	Cornwall Avenue	Ohio to W. Illinois	On-street parking both sides; west side removed	0.94	Marked bike lane	~	1.88
2011	Lakeway Drive	Birch to City Limit (Scenic)	On-street parking both sides; west side removed	0.26	Marked bike lane	~	0.52
2012	Northwest Avenue	Lottie to McLeod	On-street parking both sides; west side removed	2.16	Marked bike lane	~	4.33
2015	Ohio Street	Cornwall to Grant	On-street parking both sides; south side removed	0.27	Marked bike lane	~	0.53
2017	Orleans Street	Alabama to Indiana	On-street parking both sides; west side removed	0.43	Marked bike lane	~	0.85
2017	Woburn Street	Texas to Iowa	On-street parking both sides; west side removed	0.36	Marked bike lane	>	0.71
2018	Puget Street	Lakeway to Civic Field	On-street parking both sides; east side removed	0.09	Buffered bike lane	1.5	0.17
2019	Roeder Avenue	Coho to C Street	On-street parking west side; west side removed <sup>3</sup>	0.90	Buffered bike lane <sup>3</sup>	4	2.76
2020	James Street	Barkley to Woodstock	Rechannelization to 2 lanes + buffered bike lanes	0.76	Buffered bike lane <sup>4</sup>		0.76
				6.15			12.51

In 2022, on-street parking will need to be removed on West Illinois Avenue, Meridian Street, and Girard Street if bikeways are to be installed in 2023.

#### Improving Social Equity by Providing Bikeways in Low-Income Neighborhoods

As in Chapter 4. Primary Pedestrian Network Completeness, Figure 4.1. shows Bellingham's "Low to Moderate Income Neighborhoods" from the 2013-2017 Bellingham Consolidated Plan and Tables 5.1. and Figure 5.1. highlight bicycle projects that have been or will be completed in these neighborhoods using the same salmoncolor shading as Figure 5.2. In 2020, the bicycle facility improvements listed below are expected to be constructed by Public Works and private development interests.

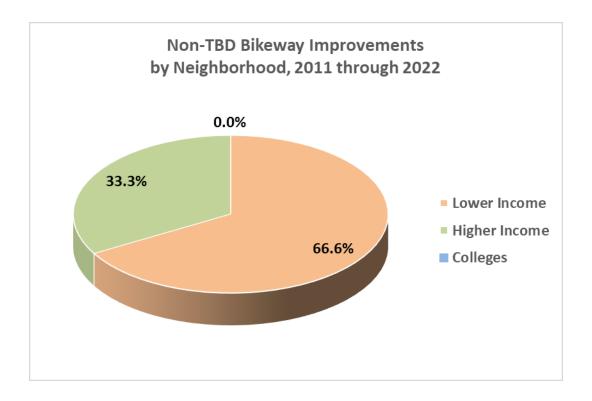

Figure 5.1. Since 2011, 66.6% of non-TBD fund bicycle projects have been in lower income neighborhoods

NOTE: All bikeway improvement projects funded by Bellingham TBD/T-Fund are listed in Chapter 6

#### Bellingham is a Gold-Level Bicycle Friendly Community

Due to the significant progress that the City has made in implementing the citywide bicycle network, in December 2020, the League of American Bicyclists promoted Bellingham from a Silver-level to a Gold-level Bicycle Friendly Community (BFC). Along with Seattle, Bellingham is now 1 of only 2 Gold BFCs in Washington and one of only 34 Gold BFCs in the United States 2020-2024 Gold-level Bicycle Friendly Community – League of American Bicyclists

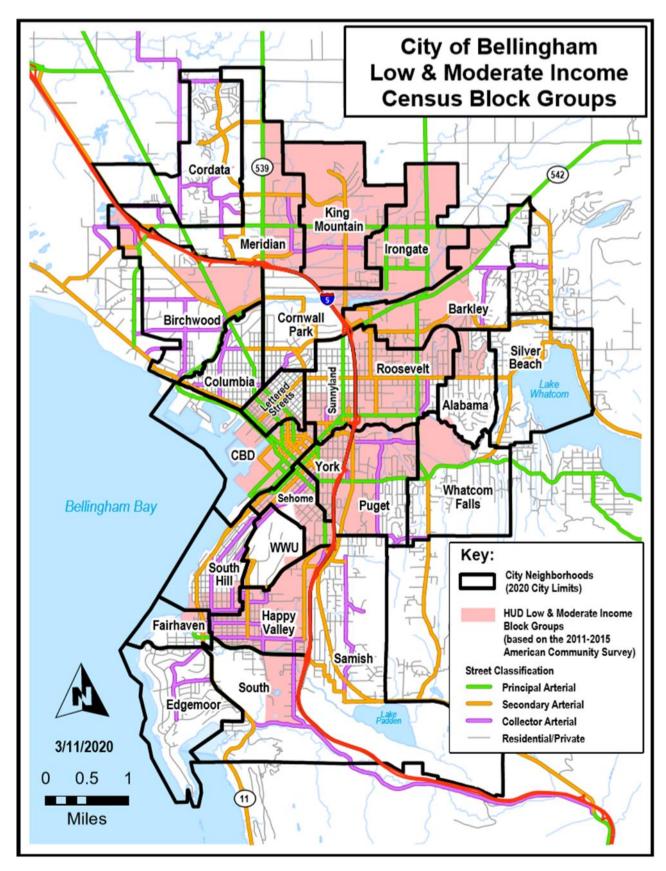

Figure 5.2. Low to Moderate Income Neighborhoods in Bellingham (See Tables 4.1., 5.1., 6.2., and 6.3.)

# Chapter 6: Transportation Fund (Former Transportation Benefit District) - 2021

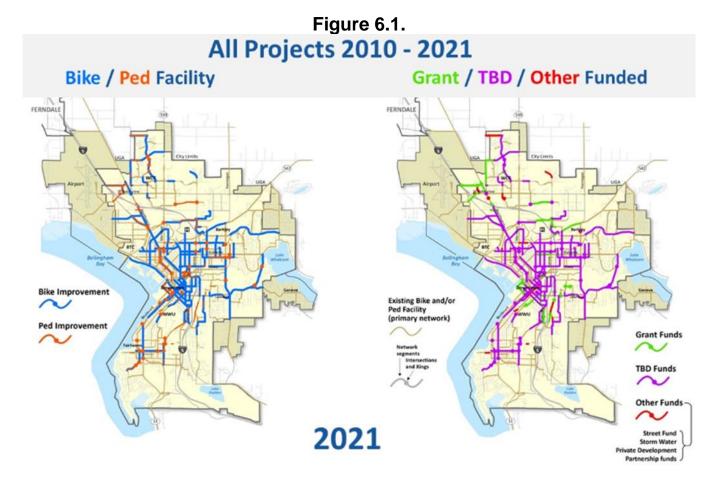

In July 2010, the Bellingham City Council created a **Transportation Benefit District (TBD)** contiguous with the City of Bellingham corporate limits. In November 2010, 58% of Bellingham voters approved a ballot measure in the general election that authorized the TBD to collect a two tenths of one percent sales tax within TBD boundaries (city limits) for a 10-year period to fund transportation infrastructure and transit service. The TBD expired December 31, 2020 with last revenue 1<sup>st</sup> Quarter 2021. The TBD was renamed the **Bellingham Transportation Fund (T-Fund)** and re-approved by 82% of voters in November 2020.

The 2010 TBD revenues were dedicated to the following activities in generally equal amounts (1/3 for each):

- Purchase of additional WTA transit bus service hours via contract between the City and WTA
- Enhance and improve pedestrian and bicycle transportation infrastructure
- Resurfacing streets to maintain the City of Bellingham's investment for all transportation users

The 2020 Transportation Fund will dedicate funding to the following activities from 2021-2030:

- Enhance and improve pedestrian and bicycle transportation infrastructure
- Resurfacing streets to maintain the City of Bellingham's investment for all transportation users
- Transit-supportive capital projects considered with asphalt resurfacing and non-motorized priorities
- Citywide transportation impact reductions identified in the Climate Action Plan

# **Transportation Fund - Transit Services**

In 2020, the Bellingham T-Fund was re-approved with transit identified as one of the priorities for T-Fund expenditures. In February 2022, the WTA Board adopted a 20-year long-range transit plan titled <u>WTA 2040</u> and the City will be partnering with WTA on the following over the next few years:

- Updates to Bellingham Pedestrian and Bicycle Master Plans
- A High-Frequency Transit Study on Select GO Lines
- Electric Bus Charging Facilities at the WTA Cordata Station
- ADA Upgrades to 200 WTA Bus Stops Throughout Bellingham
- Expansion of Downtown Bellingham Station WTA Transit Hub

# **Transportation Fund - Street Resurfacing**

Over the past century, Bellingham has made a significant investment in providing a public street system throughout the City. Public streets have a functional lifespan that varies according to the amount of use that the street is subject to and, at some point, all public streets require maintenance, repair, and resurfacing. Traditional sources of funding for street construction and resurfacing, such as Street funds and Real Estate Excise Tax (REET) funds, have been significantly diminished through budgeting decisions.

Since 2011, TBD revenue allocated to street resurfacing has helped to replace some of the Street and REET funding lost for street resurfacing projects. Approximately \$1.4 million in TBD funds have been spent each year to help maintain the City's investment in arterial streets, providing mobility for all transportation users. When streets are resurfaced, pedestrian and bicycle facilities approved in the Pedestrian and Bicycle Master Plans are also installed, whenever possible, as reflected in Tables 4.1., 5.1., 6.2, and 6.3.

Year	Street Resurface	Vehicle Lanes	On-Street Parking / Shoulder	Asphalt Lane Miles	From	То	ADA Ramps	Cross walks	Sid e walks	Parking Removal	Bike ways

# **Transportation Fund - Non-motorized Pedestrian & Bicycle Improvements**

The City Council annually approves T-Funds for a number of non-motorized transportation projects that have been approved in Bellingham's 2012 Pedestrian Master Plan (PMP) and 2014 Bicycle Master Plan (BMP) and recommended for construction by Public Works and the Transportation Commission. As shown in Figure 6.1 and the tables below, since TBD/T-Fund revenue became available for the construction of non-motorized transportation improvements in 2011, it has helped transportation planners and engineers to make significant progress in implementing the over 405 sidewalk and crossing improvement projects in the PMP and the 215 bikeway and crossing improvement projects in the BMP.

- In 2018-2019, vehicle lanes or parking were removed to install robust buffer-separated bike lanes on Barkley Boulevard, Roeder Avenue, Chestnut Street, and Cordata Parkway (pictured above).
- In 2020, one vehicle lane in each direction on the N. Samish-Maple-Ellis-York corridor was removed in favor of installing robust buffer-separated bike lanes.

In 2014, transportation planners received TBD Board approval to set aside 10% of annual TBD revenue to use as local matching funds to leverage additional state and federal grant funding for pedestrian and bicycle projects, which will allow TBD funds to be maximized. Successful examples of using TBD funds to leverage additional state and federal grant funds for pedestrian and bicycle facilities are listed in Tables 4.1. and 5.1.

In November 2014, the TBD Board also approved a 2.5% annual TBD reserve fund for transportation planners to use in the design and preliminary engineering phases of pedestrian and bicycle projects which require further study before a specific capital improvement recommendation can be made to the Transportation Commission and the TBD Board. There are several pedestrian crossing improvements listed in the Pedestrian Master Plan and several important network links in the Bicycle Master Plan that will require further study by transportation planners before engineering and construction recommendations can be made.

#### Great Success To Date, But More Work To Do In Future

As demonstrated in the Tables 6.2. and 6.3., below, Public Works has already accomplished a great deal in the 10 years that the TBD/T-Fund has been available for bicycle, pedestrian, and street resurfacing projects, but there is much more work to be done. The renewal of the T-Fund by voters in November 2020 provides critical dedicated funding to help implement Bellingham's PMP and BMP in the most expeditious manner possible. While the PMP and the BMP are a key part of the Bellingham Comprehensive Plan Transportation Element, they are not 5-, 10-, or even 20-year plans. They are on-street network plans that are completely dependent on the ability to fund sidewalk, crossing, and bicycle improvements – many of which are beyond the City's available resources.

T-Fund revenue (2021-2030) currently allocated for non-motorized transportation projects will not be enough to complete the 405 sidewalk and crossing improvement projects in the PMP and the 215 bikeway and crossing improvement projects in the BMP. In 2020, the planning level costs to complete the PMP are estimated to be about \$300 million and the BMP cost estimates are about \$50 million. Bellingham transportation planners have been extremely successful at securing state and federal transportation grants and funding allocations (Over \$50 million from 2006-2021), which allows local funding to go much further, but this is still not enough and, as currently funded, the PMP and the BMP will be completed over multiple decades. Bellingham's new ADA Transition Plan lists over \$230 million in improvements needed, some of which include PMP sidewalks.

As in Chapter 4. Primary Pedestrian Network Completeness, Figure 4.1. shows Bellingham's "Low to Moderate Income Neighborhoods" from the 2013-2017 Bellingham Consolidated Plan and Tables 6.2., 6.2.a., and 6.3., as well as Figures 6.2. and 6.3. highlight TBD-funded pedestrian and bicycle projects that have been or will be completed in these neighborhoods using the same orange-color shading as Figure 4.1.

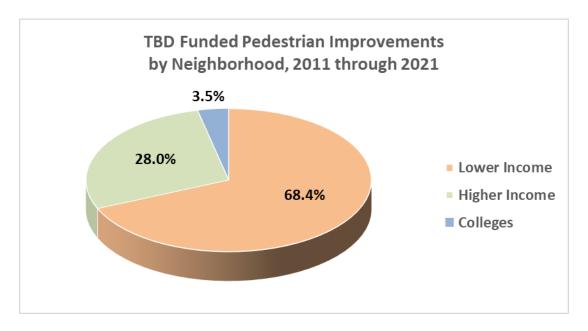

Figure 6.3. Since 2011, 68.4% of TBD funded pedestrian projects have been in lower income neighborhoods

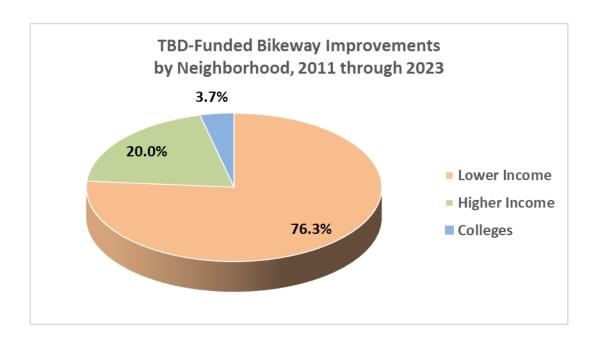

Figure 6.3. Since 2011, 76.3% of TBD funded bicycle projects have been in lower income neighborhoods

See Bellingham Bikeways Illustrated for examples and photographs of local bikeway facility types and location criteria

### **Bellingham is a Gold-Level Bicycle Friendly Community**

Due to the significant progress that the City has made in implementing the citywide bicycle network, in December 2020, the League of American Bicyclists promoted Bellingham from a Silver-level to a Gold-level Bicycle Friendly Community (BFC). Along with Seattle, Bellingham is now 1 of only 2 Gold BFCs in Washington and 1 of only 34 Gold BFCs in the United States 2020-2024 Gold-level Bicycle Friendly Community – League of American Bicyclists

# Chapter 7: Off-Street Greenways Multiuse Recreation Trails - 2021

(Provide less direct and mostly unpaved alternate, or secondary, routes than on-street transportation network)

In 2009, Bellingham transportation planners amended the multimodal transportation concurrency ordinance to make several changes to Urban Village Concurrency Service Areas and also incorporated a select inventory of bike-friendly multiuse recreational trails to the performance measures. *The inclusion of the bike-friendly multiuse recreational trails was not to declare them as an integral part of the citywide transportation network, but rather to acknowledge that some bicyclists do use these recreational trails as indirect and/or alternative routes to the on-street Primary Bicycle Network identified in the 2014 Bicycle Master Plan (BMP).* Most of these recreational trails are not suitable for road/racing bicycles because they are primarily crushed limestone gravel surfaces, vary in width and steepness, and often do not connect to major destinations. However, these multiuse trail connections can be very appealing to less confident and "interested, but concerned" bicyclists.

These bicycle-friendly trail routes were identified and field verified for ride-ability over many years by individual members of City and County Bicycle and Pedestrian Advisory Committees, the Mt. Baker Bicycle Club, as well as City staff and Parks and Recreation Advisory Board and Greenways Committee members involved in an effort called "Green Streets." Technical data came from the City's GIS layers for trails and bicycle routes, digital air photos, and digital terrain models.

The criteria that staff used to add select bike-friendly multiuse recreational trails to the list of BMC 13.70.020 Definitions Specific to Concurrency Management included:

- 1.) Off-street multiuse trails that can serve a clear transportation function, in addition to the recreational benefits that they provide, and a safe alternative to unmarked bicycle routes on arterial streets
- 2.) Prepared gravel/crushed rock surface trails, or smooth dirt with adequate drainage, and smooth even surface facilitating safe travel by cyclists. Trails with stairs, large roots, rocky sections, off-camber cross-sections, or areas with persistent standing water/puddles are generally not included
- 3.) Trails that average at least 5-feet, but preferably 8-feet, in width to facilitate safe bi-directional passage of cyclists and pedestrians
- 4.) Trails with slopes/grades of generally < 6% average with maximum grades of generally < 12%.

The bike-friendly multiuse recreational trails identified in the multimodal transportation concurrency inventory generally adhere to the specified criteria above. Some exceptions exist where lack of an alternative on-street route and the need for a critical connection dictates use of trail network sections that may have sub-standard surfaces, narrow widths, or steep grades.

Bike-friendly multiuse recreational trails are credited person trips to each Concurrency Service Area based on each comparative 1% of the total planned Primary Bicycle Network identified in the 2014 BMP. Ten (10) rather than twenty (20) person trip credits are awarded for each 1% of the total planned on-street Primary Bicycle Network in recognition that not all bicyclists will be able to use off-street gravel trails as alternatives to on-street bike routes. It should be noted, however, that several regional multiuse trails, such as the Whatcom Creek Trail, Railroad Trail, and Squalicum Creek Trail are included in the citywide bicycle network, see Figure 5.1.

# Chapter 8: WTA Primary Transit Network – 2022 (Data provided by WTA)

Whatcom Transportation Authority (WTA) provides public fixed route transit bus service, Paratransit bus service, and a vanpool program available to the public and employers. WTA is funded by sales tax revenue generated in a Public Transit Benefit Area (PTBA) that is contiguous with the boundaries of Whatcom County. WTA serves the City of Bellingham as well as the smaller towns and communities of Ferndale, Lynden, Blaine and Birch Bay, Lummi Nation, Sudden Valley, Kendall, Everson, Nooksack and Sumas. WTA also cooperates with Skagit Transit in neighboring Skagit County, to provide service between Bellingham and Mount Vernon. More information is available on the Whatcom Transportation Authority (WTA) web site.

**Fixed Route Transit Bus Service** - WTA's fixed route transit bus service features 27 routes, including a network of four high-frequency corridors within Bellingham. Service is 7 days a week, with more limited service on Saturdays, Sundays and evenings.

**Paratransit Services – Up to March 2020:** WTA's Paratransit span of service mirrored fixed route transit bus service and area. WTA provides an average of 600 Paratransit trips per weekday. Paratransit service was expanded in 2017 to mirror fixed route evening and Sunday expansion to more rural areas.

**Fleet and Facilities – Up to March 2020:** WTA's fleet includes 60 full-size buses (including eight hybrid electric buses), 37 Paratransit minibuses, and 30 vanpool vans. WTA operates four transit centers: Bellingham Station, Cordata Station (in North Bellingham), Ferndale Station and Lynden Station. Demand for vanpool service had decreased and the vanpool fleet size was reduced in 2019, but vanpool service will continue to be provided.

Integrated Transit and Transportation Planning - The City works directly with WTA on both land use and transportation issues and all of Bellingham's Urban Villages are served with high-frequency transit service. City staff worked directly with WTA in the development of the 2004 and 2016 WTA Strategic Plans and most recently on WTA's long-range transit plan titled WTA2040, approved by the WTA Board in February 2022. WTA staff worked directly with City planners in the development of the 2006 and 2016 Transportation and Land Use Elements of the Bellingham Comprehensive Plan so that City and WTA plans are fully integrated with one another.

In 2020, the Bellingham T-Fund was re-approved with transit-supportive capital improvements identified as one of the priorities for T-Fund expenditures and over the next few years, the City and WTA will collaborate on:

- Updates to Bellingham Pedestrian and Bicycle Master Plans
- A High-Frequency Transit Study on Select GO Lines
- Electric Bus Charging Facilities at the WTA Cordata Station
- ADA Upgrades to 200 WTA Bus Stops Throughout Bellingham
- Expansion of Downtown Bellingham Station WTA Transit Hub

#### The COVID-19 global pandemic has dramatically reduced WTA ridership and service.

Nationwide, mass-transit agencies have been severely impacted by the global COVID-19 pandemic and WTA is no exception. Group travel is especially susceptible to infectious disease and ridership on public transit bus, train, and light-rail has plummeted. **Pre-COVID, WWU and WCC student and faculty bus ridership accounted for approximately 40% of WTA's daily fixed route ridership.** Locally, WWU, WCC, BTC, and public and private schools transitioned from in-person to remote learning, and students stopped riding WTA buses. Since vaccinations and boosters became available and schools and universities went back to in-person learning, WTA ridership still remains very low compared to pre-COVID conditions. it will very likely take many years for WTA to recover the ridership that has been lost since March 2020. **See Figures 8.1 through 8.8 on the next pages.**

# Chapter 9: Automobile and Freight Truck Arterial Networks -2022

#### **Arterial Streets and Traffic Control**

Arterial streets, traffic signals, and roundabouts provide benefit to all users (pedestrian, bicycle, transit, automobile, and freight truck), but previous chapters have discussed pedestrian, bicycle, and transit networks and this chapter focuses on arterial streets and infrastructure as it relates to automobile and freight truck use. The <a href="Multimodal Transportation Chapter of the Bellingham Comprehensive Plan">Multimodal Transportation Chapter of the Bellingham Comprehensive Plan</a> describes the existing and planned arterial street network needed to support motorized transportation, such as transit busses, private automobiles, and freight trucks. Arterial streets and traffic control devices are depicted on Figure 8.1.

Major transportation improvements take several years to strategically plan, fund, and construct at great cost. Bellingham adopts a rolling <u>6-Year Transportation Improvement Program (TIP)</u> each June, which shows how the City plans to fund and construct major transportation projects.

Bellingham's arterial street network is locally classified into Principle, Secondary, and Collector arterials, with 2021 lane mile totals as follows:

- <u>Principal Arterial:</u> Major regional transportation corridors, including State and federal highways, that provide inbound/outbound connections between Bellingham and other cities, Whatcom and Skagit Counties, and British Columbia, Canada. Typically very high traffic volumes.
- <u>Secondary Arterial:</u> Major local transportation corridors that provide connections across, within, and between different parts of Bellingham. Typically higher to medium traffic volumes.
- <u>Collector Arterial:</u> Local transportation corridors that provide connections from neighborhood residential streets to secondary and principal arterial streets. Typically medium to lower traffic volumes.
- Residential Street: Local access to individual homes with driveways within residential neighborhoods. Typically lower traffic volumes.

In **2022**, Bellingham's arterial street network measures **312** linear miles, but with multi-lane streets, the arterial network measures **671**-lane miles and includes the following major features:

#### **Vehicle Lane Miles**

- 108 lane miles of principal arterial (16.1%)
- 110 lane miles of secondary arterial (16.4%)
- 60 lane miles of collector arterial (9.0%)
- 393 lane miles of residential streets (58.5%)

#### **Intersection Traffic Control**

- 141 intersection traffic signals (+3 in construction; +3 in engineering; +3 in planning study)
- 7 multimodal roundabouts (+2 funded; +5 seeking funding)

#### **Person-Activated Crossing Signals**

- 55 pedestrian-activated amber flashing crosswalks
- 10 pedestrian hybrid beacon red (HAWK) signals

#### **Automated Safety Warning Signs**

- 52 automated school zone flashing signs
- 2 variable message radar speed signs

Figure 9.1. Bellingham's Arterial Street Network

Figure 9.2.

#### **Bellingham's Posted Speed Limits on Arterial Streets**

The default posted speed limit on all residential streets in Bellingham is 25 miles per hour (mph). As shown in Figure 9.2., the posted speed limit on Bellingham arterial streets varies from 25 mph to 45 mph, as follows:

- 78.1% (242 miles) of posted speed limits are 25 mph;
- 13.7% (42.6 miles) of posted speed limits are 30 mph or 35 mph; and
- 8.2% (25.4 miles) of posted speed limits are more than 35\* mph.

\*As shown in red on map Figure 9.2. (previous page), with the exception of Interstate 5, there are *only 3 principal* arterial street segments in Bellingham that have posted speed limits higher than 35 mph and all 3 are at the northern and easter edge of the Bellingham urban area as it transitions into rural Whatcom County. Two of these principal arterials are multilane State Highways - SR 539 Guide-Meridian and SR 542 Mt. Baker Highway – and the third – Northwest Avenue – is two lanes with 4- to 6-foot-wide shoulders from the City limits north to Smith Road, which was just resurfaced by Whatcom County in 2020.

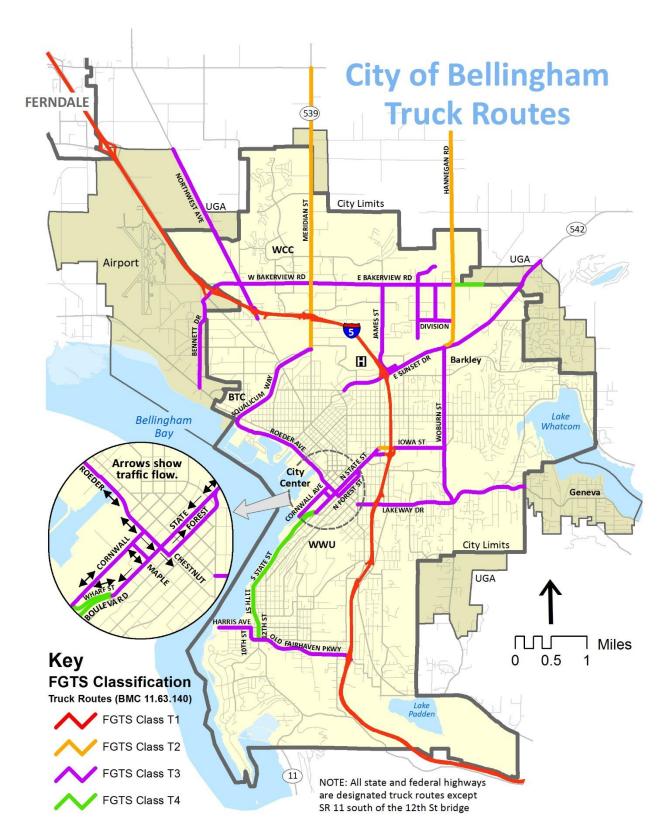

#### **Designated Freight Truck Network**

Bellingham has classified several arterial streets and all state and federal highways as Designated Freight Truck Routes, as depicted below. The City encourages major freight shipping companies to direct their drivers to primarily use the designated freight truck routes, but freight delivery trucks cannot be prevented from using any public street for deliveries unless there are weight restrictions on bridges or other public safety access restrictions. As an example, if a family is moving into or out of a house and has hired a moving company to load or unload their belongings, then the large semi-sized moving van must have access to their house via the local residential street. The same is true for large construction vehicles arriving to residential remodel sites.

Bellingham works with WCOG to collect freight truck counts and update Designated Freight Truck Route classifications by annual freight tonnage according to <u>WSDOT Freight and Goods Transportation System</u> requirements, as shown below. The classifications shown below and on maps in Bellingham transportation planning documents are subject to change based on the findings of these freight traffic counts.

Bellinghar	m Designated Freight Truck	Route Classifications
Classification	Annual Tonnage	Example (see map)
T-1	> 10 million	Interstate 5
T-2	4 - 10 million	SR 539 (Guide Meridian)
T-3	300,000 - 4 million	SR 542 (Mt. Baker Highway)
T-4	100,000 - 300,000	12 <sup>th</sup> St-State-Boulevard
T-5	< 100,000	None designated

Figure 9.3. Bellingham Designated Truck Route Network

# Chapter 10: Multimodal TIF System and Urban Village TIF Reduction Program - 2022

In December 2018, Bellingham adopted a new Multimodal Transportation Impact Fee (TIF) System based on 'person trips' rather than the traditional TIF system based on 'vehicle trips' with increasing TIF rates adopted for 2019-2025 (see below). The new Multimodal TIF system is consistent with policies and funding expectations in the Multimodal Transportation Chapter of the Bellingham Comprehensive Plan and was implemented on January 1, 2019. Bellingham is one of only four cities in Washington with Multimodal TIFs and this new program will help to provide critical funding contributions from private development to help complete the citywide pedestrian and bicycle networks, in addition to the street system for motorized auto, freight, and transit vehicles.

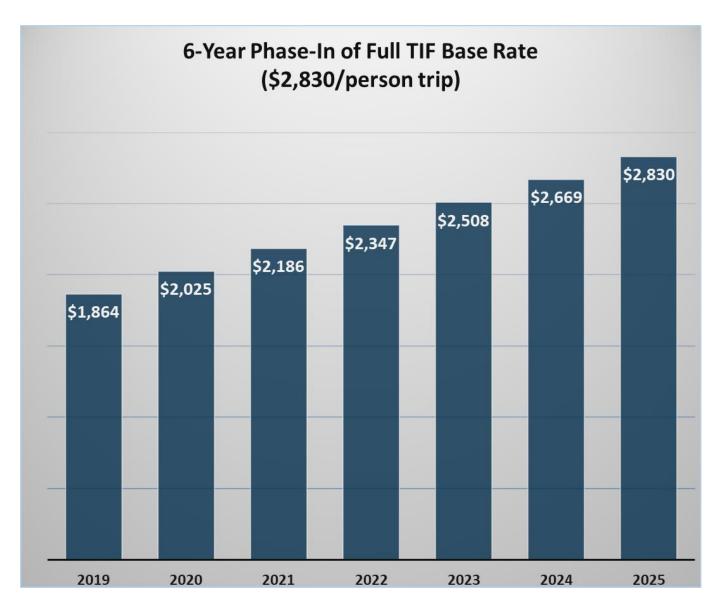

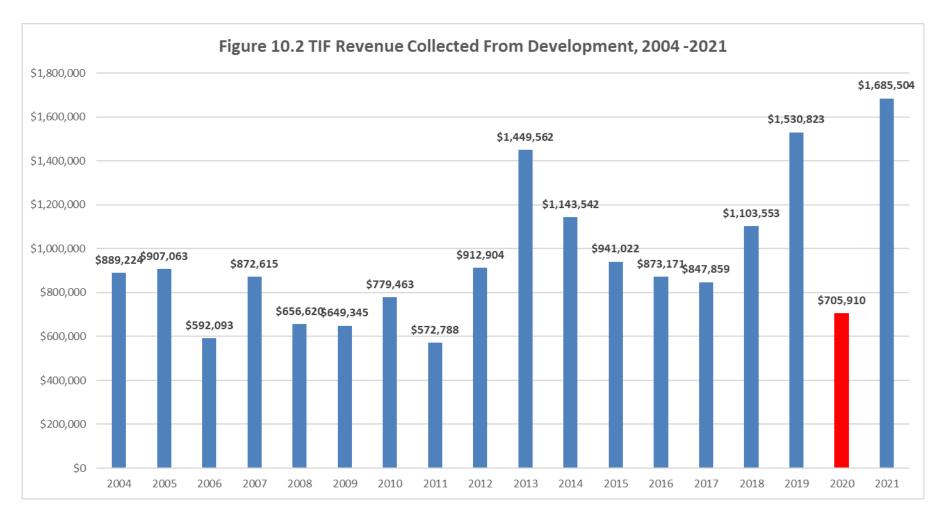

Figure 10.1 Adopted Bellingham TIF Base Rates, 2019-2025

In Bellingham, Transportation Impact Fees (TIF) were first assessed for private development beginning in 1995 with the adoption of the City's first GMA-compliant Comprehensive Plan. Figure 10.2 shows the annual totals for TIF revenue collected from private development from 2004 through 2020. While some complain that the City charges too much in TIF rates, annual TIF revenue pales in comparison to the costs of providing transportation infrastructure. In March 2020, the COVID-19 global pandemic significantly slowed private development activity and overall 2020 TIF revenue was 54% less than in 2019. In 2021, despite labor and supply chain issues, private development activity resumed and TIF revenue is essentially back to normal.

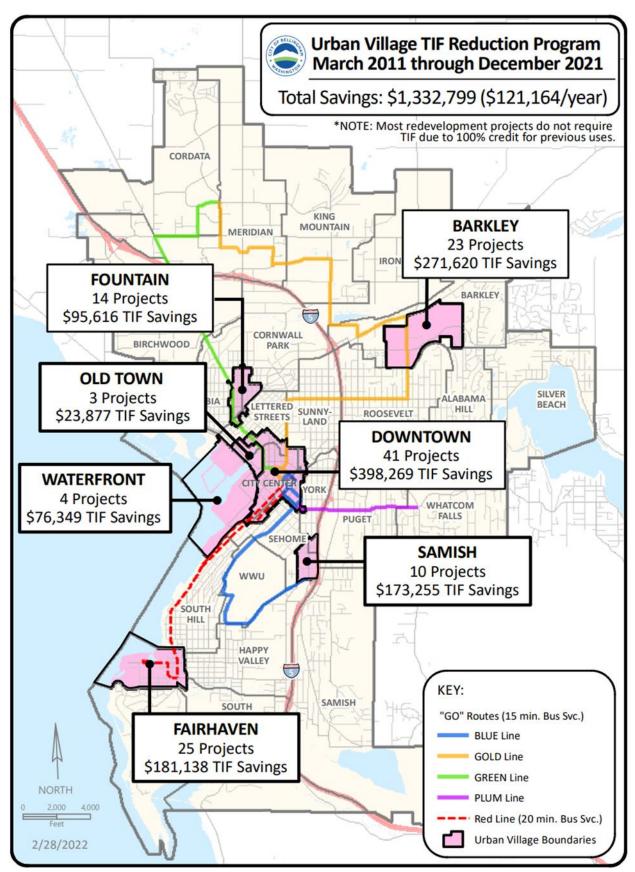

Figure 10.3. Urban Villages Eligible for TIF Reduction Program

# **Urban Village TIF Reduction Program**

In 2010-2011, Public Works created Bellingham's Urban Village Transportation Impact Fee (TIF) Reduction Program to provide an economic incentive for developers to help the City achieve its goals for infill growth in compact, mixed use Urban Villages served with complete sidewalk and bikeway networks and WTA high-frequency transit service. Success with this land use strategy is also expected to help the City achieve its long-term transportation mode shift goals (Figure 2.3 and Table 2.1).

A case study on the creation of this program is available in an article titled <u>The Urban Village TIF Reduction Program in Bellingham</u> on the City web site.

As shown in Figure 10.3 (above) and Table 10.1. (below), in the 10 years from March 2011 through December 2020, the Urban Village TIF Reduction Program has saved developers of 100 projects in Urban Villages over \$1,287,326\* in TIFs, which is an average of about \$129,000 per year.

\*NOTE: Many redevelopment projects do not require TIFs due to 100% credit for previous uses.

# Chapter 11: Waterfront District Biennial Monitoring Program - 2022

In 2010, Public Works created Concurrency Service Area (CSA) #6 for the Waterfront District in preparation for the adoption of a Waterfront District Master Plan. In 2022, CSA #6 has 1,792 PTA with no credits given yet for pedestrian facilities, bicycle lanes, or transit services, but 860 credits provided for multiuse trails.

- Cornwall Avenue has continuous sidewalks on both sides between Wharf Street and West Laurel Street
  and from Maple to Chestnut, but lack of sidewalk on the north side of the Cornwall Avenue Bridge
  requires people to cross to the south side of Cornwall to walk from downtown into the Waterfront.
- Wharf Street is a steep and narrow street without sidewalks or bicycle lanes and construction of either
  would require major excavation of the hillside, construction of major retaining walls, and significant
  environmental impact mitigation. Sidewalks and bikeways on Wharf are considered cost prohibitive.
- WTA transit service does not exist within the Waterfront District boundary. WTA does not currently have
  plans to serve the Waterfront, and it is likely to be a long time before fixed route transit service becomes
  a viable option to serve the Waterfront District.

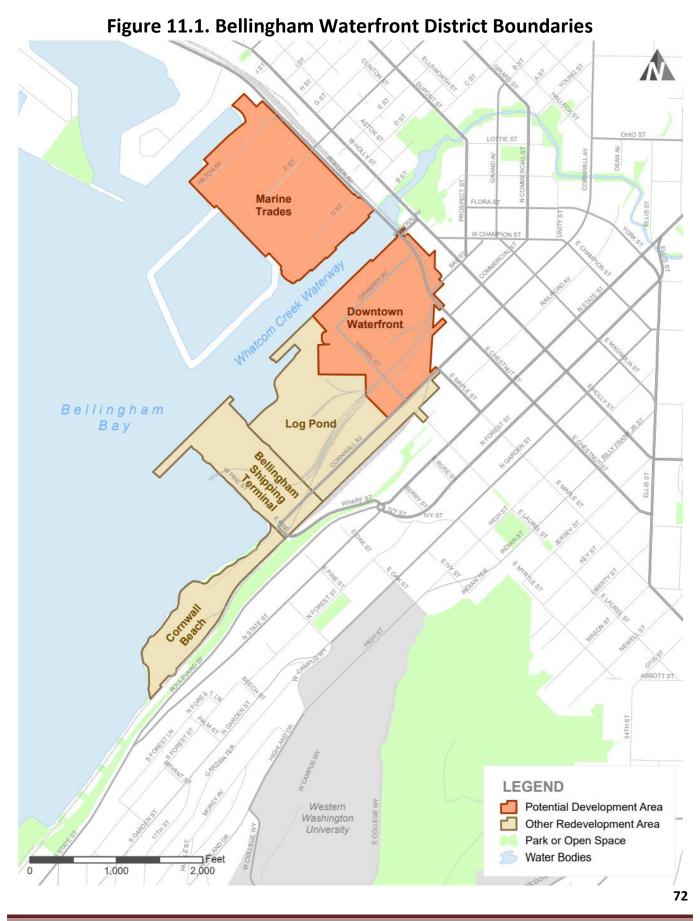

From a concurrency standpoint, additional person trip credits were awarded upon completion of new arterials, sidewalks, and bicycle lanes are constructed to increase the PTA to serve new Waterfront development in 2019. Additional person trip credits will also be awarded if and when fixed route WTA transit service becomes available to the public on Granary-Laurel within the Waterfront redevelopment area.

- Public Works constructed the Granary-Laurel arterial street in 2018-2019 in the "Downtown" portion of the Waterfront (Figure 11.1.), with sidewalks on both sides and a two-way bikeway/cycletrack on one side. These improvements added Person Trips Available to CSA #6.
- The historic Granary Building began redevelopment in 2016 as the first major project in the redevelopment of the 200-acre Waterfront District and at the beginning of 2020 is yet to be completed.
- All-American Marine Boats has relocated its manufacturing site from the Fairhaven Shipyards industrial area to the I-J Waterway in the Waterfront District.
- Itek, a major solar panel manufacturer, has relocated its manufacturing site from the Irongate Industrial Area to 800 Cornwall Avenue in the Waterfront District.

#### **Biennial Monitoring Program Report**

In December 2013, the City of Bellingham and the Port of Bellingham adopted the Bellingham Waterfront District Master Plan to guide the redevelopment of over 200 acres of industrial waterfront land into a vibrant, new neighborhood filled with a mix of industrial, commercial, institutional, residential, and public uses. The Bellingham Waterfront District Master Plan and Interlocal Agreement between the City and Port of Bellingham is available on the City web site at <a href="http://www.cob.org/services/planning/urban-villages/waterfront.aspx">http://www.cob.org/services/planning/urban-villages/waterfront.aspx</a>

Section 20 of the Interlocal Agreement for Facilities within the Waterfront District requires the Port of Bellingham to provide the City with a Biennial Monitoring Program report by December 31, 2015 and every two years after, which will document transportation mobility into and out of the Waterfront District on arterial streets for pedestrians, bicyclists, transit busses, automobiles, and freight trucks. In November 2021, TranspoGroup, Inc. completed the third Biennial Monitoring Report for the Waterfront District. Highlights from this report are included in the following pages. The Port is required to update the Biennial Monitoring Report again in late 2023 and the results will be included in the 2024 Transportation Report on Annual Mobility.

#### **Current Conditions**

The COVID-19 pandemic continues; however, data was collected in the same manner as previous studies as required by BMC requirements. Western Washington University was in full session at the time of the data collection and no stay-at-home orders were in place.

Figure 3 illustrates the average hourly distribution of traffic to and from the Waterfront District. This includes all trucks, cars, and bicycles to and from the site. The highest traffic levels for the site occurs around 4 p.m. and overall daily traffic volumes are consistent with the 2019 biennial monitoring study. Additional comparison to previous monitoring studies is provided in a later section.

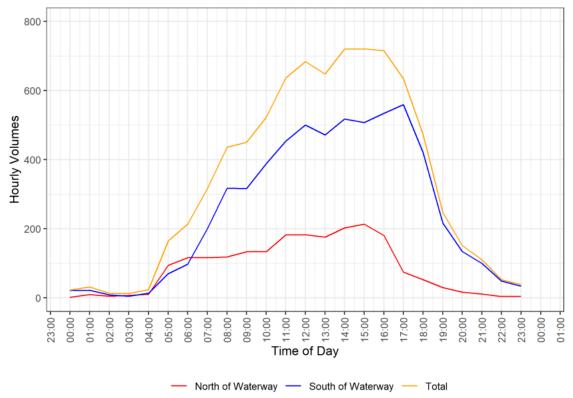

Figure 3 Waterfront District Daily Traffic Distribution

Vehicle classifications were also collected at the access points. Similar to previous monitoring studies, travel by car represents the majority of the vehicles to and from the site both north and south of the Waterway with about 65 percent of travel by car. Figure 4 illustrates the average daily vehicle classifications for the Waterfront District. Mode splits are generally consistent with the 2019 monitoring study. The number of daily trucks is higher north of the waterway compared to south given that all of the uses north of the waterway are marine and industrial.

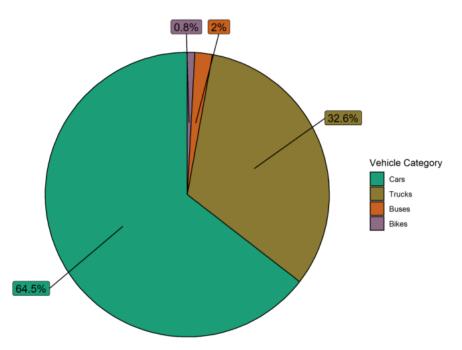

Figure 4 Waterfront District Average Daily Vehicle Classification

Figure 5 and Table 3 summarize the weekday daily and PM peak hour traffic volumes for the Waterfront District. The data collected was used to determine the weekday PM peak hour trips and mode splits for north and south of the Waterway.

Table 3. Existing (2021) Weekday	y Vehicular Traffic	Volumes <sup>1</sup>	
	Inbound	Outbound	Total
-	North of Wate	rway	
Daily Volumes	1,026	1,056	2,082

Subtotal	268	262	530	120	82%	18%	
	•	Water	front Distric	t Total		-	
Total	303	381	684	139	83%	17%	

Based on data collected in October 2021.

Table 4 shows the primary mode of travel to the site is currently via auto, which is consistent with 2019 and 2017 monitoring studies. The evaluation of mode splits only considers auto and non-motorized (pedestrian and bicycle) trips. There are no WTA bus stops located within the site. The nearest transit route operates along Holly Street. The Downtown Transit Station, which is the closest transit hub, currently has an average of approximately 1,700 boardings<sup>2</sup>. Transit ridership has been impacted by the COVID-19 pandemic and is approximately 50 percent what WTA has seen historically. Existing transit riders to the Waterfront District are captured as pedestrian or bicycle trips to and from the site; however, with on-site transit routes and bus stops transit ridership could be isolated in future studies. The Waterfront District Master Plan envisioned transit within the site; however, there are currently no plans for routes or stops.

#### **Comparison to Previous Studies**

This section provides a comparison of the 2021 traffic volumes and mode splits to the three previous Waterfront District traffic monitoring studies. Table 5 summarizes the daily, weekday PM peak hour and mode splits for north and south of the waterway.

Pedestrian/bicycle access only.

Vehicle traffic s based on the weekday PM peak hour trips along Cornwall Avenue between Maple Street and Laurel Street since Port
traffic uses Laurel Street as well as accesses driveways along Cornwall Street. The uses along Cornwall Street are industrial; therefore,
non-motorized trips are reflective of data along Laurel Street.

<sup>&</sup>lt;sup>2</sup> Data collection by Whatcom Transit Authority 2021, which represents the most recent ridership data.

	Monitoring Study Year			
	2015	2017	2019	2021
	North of Waterway	_	_	_
Daily Auto Volumes	1,460	1,780	1,745	2,082
PM Peak Hour Auto Volumes	88	171	172	154
PM Peak Hour % of Daily Volumes	6%	10%	10%	7%
PM Peak Hour Non-Motorized Volumes	10	19	9	19
PM Peak Hour Auto Mode Split	90%	90%	95%	89%
PM Peak Hour Non-Motorized Mode Split	10%	10%	5%	11%
	South of Waterway			
Daily Auto Volumes	4,330	5,345	5,825	5,963
PM Peak Hour Auto Volumes	401	664	701	530
PM Peak Hour % of Daily Volumes	9%	12%	12%	9%
PM Peak Hour Non-Motorized Volumes	54	103	252	120
PM Peak Hour Auto Mode Split	88%	87%	77%	82%
PM Peak Hour Non-Motorized Mode Split	12%	13%	23%	18%
Wa	terfront District Tot	al		
Daily Auto Volumes	5,790	7,125	7,570	8,045
PM Peak Hour Auto Volumes	489	835	873	684
PM Peak Hour % of Daily Volumes	8%	12%	12%	9%
PM Peak Hour Non-Motorized Volumes	64	122	261	139
PM Peak Hour Auto Mode Split	88%	87%	80%	83%
PM Peak Hour Non-Motorized Mode Split	12%	13%	20%	17%

Traffic volumes have increased within the Waterfront District on a daily basis; however, the weekday PM peak hour auto and non-motorized volumes are down. Some of the changes could be related to the COVID-19 pandemic. Other factors such as collection of non-motorized data along Laurel Street in 2021 rather than only along Cornwall Avenue may have also caused these volume changes, no longer accounting for non-Waterfront related pedestrians and bicyclists along Cornwall. The 2019 monitoring study identified the need to collect data at Laurel Street to better isolate non-motorized trips to and from the Port since this street provides the main access for pedestrian and bicycle travel on the southeast side of the Waterfront District especially due to new non-motorized facilities. Land uses south of Laurel Street that are accessed via Cornwall Avenue are generally industrial with limited non-motorized activity, meaning that the estimate of non-motorized traffic in the previous monitoring studies could have included non-Waterfront related activities. The reduction in non-motorized trips in 2021 results in a higher auto mode split compared to 2019; however, the 2021 auto mode split continues to be less than the 2015 and 2017 monitoring study findings.

As more mixed-use (i.e., office, retail, residential, etc.) development occurs on-site and the infrastructure becomes more walkable, it is anticipated that pedestrian, bicycle, and transit activity would continue to increase and be monitored more closely.

#### **Comparison to Previous Studies**

This section provides a comparison of the future weekday PM peak hour trip generation projection for the Waterfront District monitoring studies that have been conducted. Table 7 summarizes estimated weekday PM peak hour trip generation for the horizon year of each monitoring study.

	Future Horizon Year				
_	2019	2021	2023	2025	
Nor	th of Waterway			_	
Projected 4-Year Future Pipeline Development (sf)	50,000	45,000	49,750	21,214	
Existing Development	88	171	172	154	
Future Pipeline Development	41	31	39	85	
Internal	<u>-11</u>	<u>-15</u>	<u>-18</u>	<u>-28</u>	
Net Offsite	118	187	193	211	
Sou	th of Waterway			_	
Projected 4-Year Future Pipeline Development (sf)	473,874	962,462	624,348	328,798	
Existing Development	401	664	701	530	
Future Pipeline Development	493	780	589	389	
Internal	<u>-77</u>	<u>-101</u>	<u>-103</u>	<u>-128</u>	
Net Offsite	817	1343	1187	791	
Waterf	ront District To	tal		-	
Projected 4-Year Future Pipeline Development (sf)	523,874	1,007,462	674,098	350,012	
Existing Development	489	835	873	684	
Future Pipeline Development	534	811	628	474	
Internal	<u>-88</u>	<u>-116</u>	<u>-121</u>	<u>-156</u>	
Net Offsite	935	1,530	1,380	1,002	

Notes: sf = square-feet

As shown in the table, estimated future net offsite trips are less in 2021 than projected for the two previous monitoring studies. The lesser trip generation is due to overall fewer existing trips and less development projected in the next 4 years. North of the waterway, the future forecasted trip generation in 2025 is higher than projected in the previous monitoring studies with less square-footage being developed due to the mix of land use including retail and restaurant development by 2025 whereas the previous studies assumed only industrial and office uses.

#### Future Traffic Volumes and Transportation Infrastructure Phasing Plan

The future vehicle trips were distributed to the site access points based on the location of the proposed development as well as consideration of planned infrastructure improvements and offsite travel patterns. The access points and capacity were identified in the Waterfront District EIS. North of the waterway vehicle trips are distributed to Hilton Avenue, F Street and C Street. South of the waterway vehicle trips are distributed to Granary Avenue, Cornwall Avenue/Laurel Street/Maple Street, and Wharf Street. The existing trips were not reassigned since there are no new site access points proposed. Table 8 provides a summary of the existing and future outbound PM peak hour trips for site access points as well as the remaining capacity with the future development over the next 4-years and the planned infrastructure.

Based on data collection from the 2015 – 2021 Bellingham Waterfront Biennial Traffic Monitoring Study.

Table 8. Future (2025) Infrastructure Capacity Summary							
PM Peak Hour Outbound Vehicle Trips			Estimated Vehicle	Remaining Capacity			
Existing T	rips <sup>1</sup> Net N	ew Trips <sup>2</sup>	Future Trips	Capacity (Trips) <sup>3</sup>	Trips	Square-feet <sup>4</sup>	
North of Waterway⁵							
119		30	149	400	251 (63%)	350,000	
South of Waterway <sup>6</sup>							
262		143	401	900	499 (55%)	850,000	

- Based on October 2021 traffic counts.
- Calculated based on person trip methodology outlined in the Waterfront District EIS and assigned based on the location of development with consideration of planned infrastructure improvements and offsite travel patterns.
- Based on the infrastructure phasing analysis as documented in the memorandum subjected The Waterfront District Subarea Plan Transportation Analysis Update for 2012 SEIS Addendum, October 2012 with consideration of improvements that have been completed.
- Approximate millions of square-feet (sf) of development is provided for reference and is based on the average outbound vehicle trip rate
  as documented in the memorandum subjected The Waterfront District Subarea Plan Transportation Analysis Update for 2012 SEIS
  Addendum. October 2012.
- 5. Infrastructure capacity is based on access via Hilton Avenue, F Street and C Street.
- 6. Infrastructure capacity is based on access via Granary Avenue, Cornwall Avenue/Laurel Street/Maple Street and Wharf Street.

As shown in Table 8, the proposed infrastructure would accommodate the anticipated development over the next 4-years. North of the Waterway, the proposed development is anticipated to use approximately 37 percent of the infrastructure capacity leaving 63 percent of the capacity available for future development. South of the Waterway, the proposed development is anticipated to use approximately 45 percent of the infrastructure capacity. The remaining capacity would accommodate additional development; however, the location of future development will also need to be considered when determining if it can be accommodated without additional infrastructure improvements. Conducting the traffic monitoring study every 2-years will capture changes in development estimates, location and timing of development and verify infrastructure needs.

# **Findings**

Based on the review presented above, no additional infrastructure improvements are recommended. Plans for development beyond what has been analyzed herein should consider the available capacity for each area. In addition, the evaluation of infrastructure capacity remaining for the site after the projected 2025 development is conservative since all existing site uses are anticipated to remain, and as development occurs existing uses may be redeveloped reducing trips from the site.
